UPDATE ON FOC UV THROUGHPUT MONITORING TEST

H.Hasan

July 17, 1992

The UV throughput monitoring test conducted on July 1, 1992 has been analysed following the procedure described in the Instrument Science Report, OTA-08. The results are plotted together with earlier data in Figures 1 and 2. As before, a non-linear least squares fit was performed and the fits overplotted on the data.

There continues to be slight downward trend for filters F140M, F210M and F210M, while throughput for filter F170M continues to be stable over time.
