ABSTRACT

At luminosities above $10^{11.4} L_{\text{sun}}$, the space density of far-infrared selected galaxies exceeds that of optically selected galaxies. These 'luminous infrared galaxies' (LIRGs) are primarily interacting or merging disk galaxies undergoing enhanced star formation and Active Galactic Nuclei (AGN) activity, possibly triggered as the objects transform into massive S0 and elliptical merger remnants. We propose ACS/WFC imaging of a complete sample of $88 L_{\text{IR}} > 10^{11.4} L_{\text{sun}}$ luminous infrared galaxies in the IRAS Revised Bright Galaxy Sample (RBGS: i.e., 60 micron flux density > 5.24 Jy). This sample is ideal not only in its completeness and sample size, but also in the proximity and brightness of the galaxies. The superb sensitivity, resolution, and field of view of ACS/WFC on HST enables a unique opportunity to study the detailed structure of galaxies that sample all stages of the merger process. Imaging will be done with the F439W and F814W filters (B and I-band) to examine as a function of both luminosity and merger state (i) the evidence at optical wavelengths of star formation and AGN activity and the manner in which instabilities (bars and bridges) in the galaxies may funnel material to these active regions, (ii) the relationship between star formation and AGN activity, and (iii) the structural properties (AGN, bulge, and disk components) and fundamental parameters (effective radius and surface brightness) of LIRGs and their similarity with putative evolutionary byproducts (elliptical, S0 and classical AGN host galaxies). This HST survey will also bridge the wavelength gap between a Spitzer imaging survey (covering seven bands in the 3.6-160 micron range) and a GALEX UV imaging survey of these galaxies, but will resolve complexes of star clusters and multiple nuclei at resolutions well beyond the capabilities of either Spitzer or GALEX. The combined datasets will result in the most comprehensive multiwavelength study of interacting and merging galaxies to date.

OBSERVING DESCRIPTION

Proposal 10592 - Overview

ACS/WFC imaging observations of the RBGS sample are done at F435W and F814W. Observations with the F435W are done in three 420 second integrations using the LINE dither routine. Observations with the F814W filter are done in two 360 second integrations.

REAL TIME JUSTIFICATION

None.

CALIBRATION JUSTIFICATION

None.

ADDITIONAL COMMENTS

None.
