

10802 - SHOES-Supernovae,HO,for the Equation of State of Dark energy

Cycle: 15, Proposal Category: GO

(Availability Mode: AVAILABLE)

INVESTIGATORS

<i>Name</i>	<i>Institution</i>	<i>E-Mail</i>
Dr. Adam Riess (PI)	Space Telescope Science Institute	
Dr. Louis G. Strolger (CoI)	Western Kentucky University	
Dr. Robert P. Kirshner (CoI)	Harvard University	
Mr. Peter Challis (CoI)	Harvard University	
Dr. Harry C. Ferguson (CoI)	Space Telescope Science Institute	
Dr. Hubert Lampeitl (CoI)	Space Telescope Science Institute	
Dr. Peter B. Stetson (CoI)	Dominion Astrophysical Observatory	
Dr. Lucas M. Macri (CoI)	National Optical Astronomy Observatories, AURA	
Dr. Stefano Casertano (CoI)	Space Telescope Science Institute	
Dr. Weidong Li (CoI)	University of California - Berkeley	
Dr. Alex V. Filippenko (CoI)	University of California - Berkeley	
Dr. John L. Tonry (CoI)	University of Hawaii	

VISITS

<i>Visit</i>	<i>Targets used in Visit</i>	<i>Configurations used in Visit</i>	<i>Orbits Used</i>	<i>Last Orbit Planner Run</i>	<i>OP Current with Visit?</i>
11	(1) NGC4639-RED ANY	ACS/WFC NIC2	1	04-Sep-2007 21:06:11.0	yes

233 Total Orbits Used

ABSTRACT

The present uncertainty in the value of the Hubble constant (resulting in an uncertainty in Ω_M) and the paucity of Type Ia supernovae at redshifts

exceeding 1 are now the leading obstacles to determining the nature of dark energy. We propose a single, integrated set of observations for Cycle 15 that will provide a 40% improvement in constraints on dark energy. This program will observe known Cepheids in six reliable hosts of Type Ia supernovae with NICMOS, reducing the uncertainty in H_0 by a factor of two because of the smaller dispersion along the instability strip, the diminished extinction, and the weaker metallicity dependence in the infrared. In parallel with ACS, at the same time the NICMOS observations are underway, we will discover and follow a sample of Type Ia supernovae at $z > 1$. Together, these measurements, along with prior constraints from WMAP, will provide a great improvement in HST's ability to distinguish between a static, cosmological constant and dynamical dark energy. The Hubble Space Telescope is the only instrument in the world that can make these IR measurements of Cepheids beyond the Local Group, and it is the only telescope in the world that can be used to find and follow supernovae at $z > 1$. Our program exploits both of these unique capabilities of HST to learn more about one of the greatest mysteries in science.

OBSERVING DESCRIPTION

This observing program has two complementary approaches to studying dark energy: constraining the Hubble constant, and measuring the luminosity distance to high-redshift SNe~Ia. We propose the following strategy to combine the two investigations:

Observe with NICMOS F160W the six galaxies with the highest-quality SN~Ia data sets within ~ 30 Mpc, measuring at least 12 known Cepheids of optically-determined period at

each of 4 epochs.

Use ACS to discover ~ 6 SNe~Ia at $z > 1$ in four parallel fields near each galaxy (see Fig. 3).

Obtain ACS grism spectra and light

curves of new SNe, {it collecting more Cepheids in parallel.}

Use 8 orbits to obtain H -band

magnitudes of long-period Cepheids in NGC 4258 identified from Gemini

by Macri et al. (2006) to extend the useful range of the NGC 4258 P - L relation.
