75 Total Orbits Used

ABSTRACT

During the past few years, robotic (or nearly robotic) searches for supernovae (SNe), most notably our Lick Observatory Supernova Search (LOSS), have found hundreds of SNe, many of them in quite nearby galaxies ($cz < 4000$ km/s). Most of the objects were discovered before maximum brightness, and have follow-up photometry and spectroscopy; they include some of the best-studied SNe to date. We propose to conduct a snapshot imaging survey of the sites of some of these nearby objects, to obtain late-time photometry that (through the shape of the light and color curves) will help reveal the origin of their lingering energy. The images will also provide high-resolution information on the local environments of SNe that are far superior to what we can procure from the ground. For example, we will obtain color-color and color-magnitude diagrams of stars in these SN sites, to determine the SN progenitor masses and constraints on the reddening. Recovery of the SNe in the new HST images will also allow us to actually pinpoint their progenitor stars in cases where pre-explosion images exist in the HST archive. This proposal is an extension of our successful Cycle 13 snapshot survey with ACS. It is complementary to our Cycle 15 archival proposal, which is a continuation of our long-standing program to use existing HST images to glean information about SN environments.

OBSERVING DESCRIPTION

We wish to obtain ACS/HRC snapshot images of the sites of nearby, recent SNe discovered or monitored by LOSS. Most of the objects are core-collapse SNe, which have massive short-lived progenitors (making it also possible to study individual stars in their local environment), but a few important SNe Ia (e.g., SN 2002du) will also be imaged to obtain late-time measurements in crowded environments. The use of standard wide bands will permit direct comparisons with other HST observations. Although there are painful tradeoffs, we feel that ACS/HRC is superior to ACS/WFC for our purposes: the overheads with the HRC are much lower than those with the WFC, allowing us to obtain images with 2 filters (instead of 1) in a given visit, and thus giving us the color of the SN. Also, the immediate environment of the SN will be resolved better.

Given the constraints of snapshot observations (less than 1 orbit per target), the desire to go fairly deep, and the advantage of having some color information for SNe (and their environments), the use of 4 filters (BVRI = F435W, F555W, F625W, F814W) is deemed optimal. [We used only 2 filters in Cycle 9 (GO-8602), but this did not allow us to set strong constraints on the reddening in the local SN environment.] U-band observations would be prohibitively time-consuming.

For a single visit to be about 34 minutes long (the peak of the distribution of snapshot visits has historically been around 30--35 minutes, according to the HST Snapshot document at http://www.stsci.edu/hst/HST_overview/documents/), there can be only one filter change and only one CR-SPLIT pair of HRC exposures through each filter. Each pair of exposures averages 10 min in length, but the results will be superior to those of longer exposures with the WFPC2.

Using the ACS/HRC exposure estimator, we find that for a $V=24$ mag B5 star with a 10-min CR-SPLIT exposure in each band, we can achieve a signal-to-noise ratio (S/N) of 18 (B), 16 (V), 14 (R), 9 (I). For a $V=24$ mag K0 star the corresponding numbers are $S/N = 7$ (B), 15 (V), 20 (R), 20 (I). Since we expect a mixture of star colors (old SNe tend to be red, but their associated stellar populations can be blue), we want to get a good balance of exposures times, so that B and I are not substantially worse than V and R. Thus, we will obtain BR exposures in one visit (with 70% of the exposure time going to B), and VI exposures in another visit (with 60% of the exposure time going to I). If a given galaxy is visited only once, we will still be able to derive useful constraints on the stellar population with V vs. V-I or with B vs. B-R, as shown by Van Dyk et al. (1999a), although having all 4 bands would obviously be better, especially for estimating the reddening. Moreover, obtaining even a single color for a SN (B-R or V-I) is superior to acquiring only single-filter observations.

The S/N calculated above will allow us to get good late-time points on the light curves of many of our SNe during Cycle 15, given their current decline rates (as measured by us with KAIT). Moreover, for the studies of the environments, our typical distance moduli are about 31 mag, so $V = 24$ leads to $M_V = -7$ mag and we will be able to set useful constraints on the stellar populations. For closer galaxies, with $\mu = 29$ -30 mag, we reach $M_V = -5$ to -6 mag, corresponding to the top of the main sequence and bright supergiants (stars probably similar to a SN's core-collapse progenitor). With multiple visits to some objects, we will be able to probe even deeper.

We choose 20-27 of the recent nearby SNe as the targets of our current snapshot study. We concentrate on the most recent ones (which have the highest probability of being detected in the HST images), as well as on long-lived SNe (as judged from their continuously-updated KAIT light curves). We also emphasize core-collapse SNe for which pre-explosion HST archival images are available, in order to maximize our chances of directly identifying the progenitor star once we know the precise location of the SN (from our new images). More SNe will be discovered before the

Phase II deadline, and we will select the best objects to observe; the merits of all eligible SNe will be compared in detail. The Phase I deadline greatly helps our program, because most of the proposed SNe will still be bright enough to detect in the HST images when the Cycle begins.

We want an average of 3 visits per object (2 visits for a majority of objects, but up to 5 visits for the most important ones), our total request is 75 visits at about 34 minutes per visit).

The specific list of 27 recent, eligible SNe is as follows; consult the IAU Circulars for details: 1993J, 2004dj, 2005cs, 1961V, 2005af, 2005ay, 2005kl, 2006bp, 2005cf, 2004gq, 2005ip, 2005cc, 2005P, 2004dk, 2004gq, 2005el, 2005da, 2005ek, 2005bf, 2005hg, 2003L, 2003gq, 2002cx, 2002ic, and 2005gj.

	The diagram illustrates the timing of exposures for Orbit 1. The horizontal axis represents time in seconds, ranging from 0 to 5500. A blue checkered bar indicates the period of 'Unused Visibility = 797' seconds, from approximately 350s to 1147s. Exposures are marked with green icons and labels: 'Exp. 1, split 1' at ~350s, 'Exp. 1, split 2' at ~900s, 'Exp. 2, split 1' at ~1350s, and 'Exp. 2, split 2' at ~1950s. Other phases shown include 'GS Acq' at ~100s, 'Overhead' at ~2350s, and 'Occultation' starting at ~3150s.

Orbit Structure	Orbit 1 Server Version: 20080807									
	The diagram illustrates the timing of observations for Orbit 1. The horizontal axis represents time in seconds, ranging from 0 to 5500. A blue checkered bar indicates the period of visibility, starting at approximately 300 seconds and ending at 2400 seconds. Key events are marked with arrows and labels: 'GS Acq' at 0s, 'Exp. 1, split 1' at 300s, 'Exp. 1, split 2' at 900s, 'Exp. 2, split 1' at 1300s, 'Exp. 2, split 2' at 1900s, 'Overhead' at 2300s, and 'Occultation' at 3100s. The total unused visibility is noted as 834 seconds. The exposure times for the four exposures are 460.0, 460.0, 700.0, and 700.0 seconds respectively.

	The diagram illustrates the timing of exposures for Orbit 1. The horizontal axis represents time in seconds, ranging from 0 to 5500. A blue checkered bar indicates the period of 'Unused Visibility = 908' seconds, from approximately 350s to 1258s. Exposures are marked with green boxes containing a camera icon and labeled as follows: - Exp. 1, split 1: Starts at ~350s, ends at ~810s. - Exp. 1, split 2: Starts at ~810s, ends at ~1270s. - Exp. 2, split 1: Starts at ~1270s, ends at ~1730s. - Exp. 2, split 2: Starts at ~1730s, ends at ~2190s. Other labeled intervals include 'GS Acq' (0-350s), 'Overhead' (2190-2350s), and 'Occultation' (2350-5500s). A green bar highlights the period from 2350s to 3200s.

Orbit Structure	Orbit 1 Server Version: 20080807									
	The diagram illustrates the timing of observations for Orbit 1. The x-axis represents time in seconds, ranging from 0 to 5500. The timeline includes the following phases: GS Acq: Ground Station Acquisition phase at the beginning. Exp. 1, split 1: First exposure split, starting around 400s. Exp. 1, split 2: Second exposure split, starting around 900s. Exp. 2, split 1: Third exposure split, starting around 1300s. Exp. 2, split 2: Fourth exposure split, starting around 1900s. Overhead: Overhead time, starting around 2300s. Occultation: Occultation phase, starting around 3100s. The total duration of the orbit is 5500 seconds. The Unused Visibility is 817 seconds.

Orbit Structure	Orbit 1 Server Version: 20080807									
	The diagram illustrates the timing of observations for Orbit 1. The horizontal axis represents time in seconds, ranging from 0 to 5500. Key events are marked with green icons and labels: 'GS Acq' at approximately 100s, 'Exp. 1, split 1' at 460s, 'Exp. 1, split 2' at 960s, 'Exp. 2, split 1' at 1360s, and 'Exp. 2, split 2' at 1960s. A blue checkered bar indicates the 'Unused Visibility' period from approximately 460s to 2460s, with a total duration of 797 seconds. A green bar represents the 'Overhead' period from approximately 2460s to 3160s. A white bar indicates the 'Occultation' period starting at approximately 3160s and continuing until the end of the orbit at 5500s.

	Server Version: 20080807 The diagram shows a timeline from 0 to 5500 seconds. A blue hatched bar represents the total observation period from approximately 250s to 2350s. Within this, green boxes indicate exposure periods: Exp. 1, split 1 (250-350s), Exp. 1, split 2 (350-450s), Exp. 2, split 1 (450-550s), and Exp. 2, split 2 (550-650s). A green bar from 2350s to 3100s is labeled 'Unused Visibility = 883'. A grey bar from 3100s to 3200s is labeled 'Overhead'. A white bar from 3200s to 5500s is labeled 'Occultation'.
