ABSTRACT

The structure, formation and evolution of early-type galaxies is still largely an open problem in cosmology: how does the Universe evolve from large linear scales dominated by dark matter to the highly non-linear scales of galaxies, where baryons and dark matter both play important, interacting, roles? To understand the complex physical processes involved in their formation scenario, and why they have the tight scaling relations that we observe today (e.g. the Fundamental Plane), it is critically important not only to understand their stellar structure, but also their dark-matter distribution from the smallest to the largest scales.

Over the last three years the SLACS collaboration has developed a toolbox to tackle these issues in a unique and encompassing way by combining new non-parametric strong lensing techniques, stellar dynamics, and most recently weak gravitational lensing, with high-quality Hubble Space Telescope imaging and VLT/Keck spectroscopic data of early-type lens systems. This allows us to break degeneracies that are inherent to each of these techniques separately and probe the mass structure of early-type galaxies from 0.1 to 100 effective radii. The large dynamic range to which lensing is sensitive allows us both to probe the clumpy substructure of these galaxies, as well as their low-density outer haloes. These methods have convincingly been demonstrated, by our team, using smaller pilot-samples of SLACS lens systems with HST data.

In this proposal, we request observing time with WFPC2 and NICMOS to observe 53 strong lens systems from SLACS, to obtain complete multi-color imaging for each system. This would bring the total number of SLACS lens systems to 87 with completed HST imaging and effectively doubles the known number of galaxy-scale strong lenses. The deep HST images enable us to fully exploit our new techniques, beat down low-number statistics, and probe the structure and evolution of early-type galaxies, not only with a uniform data-set an order of magnitude larger than what is available now, but also with a fully coherent and self-consistent methodological approach!

OBSERVING DESCRIPTION

The goal of our observations is to obtain high signal to noise spatially resolved photometry through filters WFPC2/F606W and NIC2/F160W. In combination with existing "discovery" ACS/F814W images, multi-color information will be used to derive accurate surface photometry of the lens galaxy -- corrected for dust extinction -- and thus pinpoint the distribution of luminous mass (i.e. measure effective radii to <10 percent, magnitudes

to <0.1 mags, PA to better than 5 deg). We will exploit the multicolor information to subtract the light from the lens galaxy (massive ellipticals are in general very uniform in color) and compute extinction corrected images of the Einstein Rings (e.g. Koopmans et al. 2003). Precise removal of the lens galaxy contamination and of reddening correction is key to the success of non parametric mass reconstruction methods.

Proposal 11202 - Visit 54 - The Structure of Early-type Galaxies: 0.1-100 Effective Radii

Proposal 11202 - Visit S1 - The Structure of Early-type Galaxies: 0.1-100 Effective Radii

Visit	Proposal 11202, Visit S1, completed Tue Mar 02 02:11:56 GMT 2010									
	Diagnostic Status: Warning Scientific Instruments: WFC3/IR Special Requirements: GYRO MODE 3GOBAD									
Diagnostics	(Visit S1) Warning (Form): Gyro Mode overrides default value of 2G.									
Patterns	#	Primary Pattern				Secondary Pattern			Exposures
