ABSTRACT

Planetary nebulae (PNe) in globular clusters (GCs) raise a number of interesting issues related to stellar and galactic evolution. The number of PNe known in Milky Way GCs, 4, is surprisingly low if one assumes that all stars pass through a PN stage. However, it is likely that the remnants of stars now evolving in Galactic GCs leave the AGB so slowly that any ejected nebula dissipates long before the star becomes hot enough to ionize it. Thus there should not be ANY PNe in Milky Way GCs--but there are four! It has been suggested that these PNe are the result of mergers of binary stars within GCs, i.e., that they are descendants of blue stragglers. The frequency of occurrence of PNe in external galaxies poses more questions, because it shows a range of almost an order of magnitude.

I propose a Snapshot survey aimed at discovering PNe in the GC systems of Local Group galaxies more distant than the Magellanic Clouds. These clusters, some of which may be much younger than their counterparts in the Milky Way, might contain many more PNe than those of our own galaxy. I will use the standard technique of emission-line and continuum imaging, which easily discloses PNe.

OBSERVING DESCRIPTION

In this snapshot program, I will search for planetary nebulae in globular clusters of the Local Group. For each target, the exposure will be 2x500 sec in the [O III] 5007 filter F502N, along with 2x100 sec in the nearby continuum filter F555W. There will be a dither of 11 PC pixels in x and y between the exposures. Most of the targets will be centered in the WFPC2/PC chip, but a few larger objects will be centered at WF-ALL, and the exposures will be 2x200 and 2x30 sec.

Proposal 11218 - Visit 01 - Snapshot Survey for Planetary Nebulae in Globular Clusters of the Local Group

Orbit Structure

Orbit 1

Server Version: 20080807

The diagram illustrates the timeline of Orbit 1, showing the sequence of events and the duration of each exposure. The timeline is marked from 0 to 5500 seconds. Key events include:

- GS Acq (Ground Station Acquisition) at approximately 0 seconds.
- Exp. 1 (Exposure 1) at approximately 400 seconds.
- Exp. 2 (Exposure 2) at approximately 700 seconds.
- Pointing Maneuver at approximately 1200 seconds.
- Exp. 3 (Exposure 3) at approximately 1500 seconds.
- Exp. 4 (Exposure 4) at approximately 1800 seconds.
- Overhead at approximately 2300 seconds.
- Unused Visibility = 834 at approximately 2400 seconds.
- Occultation at approximately 3200 seconds.

The timeline is divided into segments by these events. The segments are color-coded: blue for GS Acq, green for Exposures, yellow for Pointing Maneuver, red for Overhead, and white for Unused Visibility. The Occultation segment is marked with a vertical line.

										[==>]	[1]
Orbit Structure	Orbit 1 Server Version: 20080807 The diagram illustrates the timeline of Orbit 1, spanning from 0 to 6000 seconds. Key events include: GS Acq: Ground Station Acquisition at the start. Exp. 1: Exposure 1 (F555W) at ~400s, duration 100s. Exp. 2: Exposure 2 (F502N) at ~700s, duration 500s. Exp. 3: Exposure 3 (F555W) at ~1500s, duration 100s. Exp. 4: Exposure 4 (F502N) at ~1800s, duration 500s. Overhead: Periods between exposures. Pointing Maneuver: Occurs between Exp. 2 and Exp. 3. Unused Visibility: A period of 834 seconds following the last exposure. Occultation: Begins at ~3200s and continues until the end of the orbit.										

Proposal 11218 - Visit 60 - Snapshot Survey for Planetary Nebulae in Globular Clusters of the Local Group

Orbit Structure	Orbit 1 Server Version: 20080807 The diagram illustrates the timeline of Orbit 1. It starts with 'GS Acq' at 0 seconds. A blue checkered bar represents the first exposure, labeled 'Exp. 1' and 'Exp. 2'. This is followed by a 'Pointing Maneuver' and 'Overhead' period. Then, another blue checkered bar represents 'Exp. 3' and 'Exp. 4'. This is followed by another 'Overhead' period, labeled 'Unused Visibility = 834'. Then, a green bar represents a second exposure. This is followed by another 'Overhead' period, labeled 'Occultation'. Finally, a long white bar represents the remainder of the orbit, ending at 5500 seconds.

Orbit Structure

Orbit 1

Server Version: 20080807

The diagram illustrates the timeline of Orbit 1, showing the sequence of events and their durations. The x-axis represents time in seconds, ranging from 0 to 5500. The events are as follows:

- GS Acq: Ground Station Acquisition, occurring at the start of the orbit.
- Exp. 1: Exposure 1, occurring at approximately 400 seconds.
- Exp. 2: Exposure 2, occurring at approximately 700 seconds.
- Pointing Maneuver: Occurring at approximately 1300 seconds.
- Exp. 3: Exposure 3, occurring at approximately 1500 seconds.
- Exp. 4: Exposure 4, occurring at approximately 1800 seconds.
- Overhead: Occurring at approximately 2400 seconds.
- Unused Visibility = 814: A period of 814 seconds of unused visibility, occurring at approximately 2400 seconds.
- Occultation: Occurring at approximately 3200 seconds.

The timeline is divided into segments by these events. The segments are color-coded: blue for GS Acq, green for Exposures, yellow for Pointing Maneuver, red for Overhead, and white for Unused Visibility. The Occultation segment is marked with a vertical line.
