ABSTRACT

Recent systematic surveys of strong galaxy-galaxy lenses (CLASS, SLACS, GOODS, etc.) are producing spectacular results for galaxy masses roughly below a transition mass $M \sim 10^{13}$ Mo. The observed lens properties and their evolution up to $z \sim 0.2$, consistent with numerical simulations, can be described by isothermal elliptical potentials. In contrast, modeling of giant arcs in X-ray luminous clusters (halo masses $M > \sim 10^{13}$ Mo) favors NFW mass profiles, suggesting that dark matter halos are not significantly affected by baryon cooling. Until recently, lensing surveys were neither deep nor extended enough to probe the intermediate mass density regime, which is fundamental for understanding the assembly of structures. The CFHT Legacy Survey now covers 125 square degrees, and thus offers a large reservoir of strong lenses probing a large range of mass densities up to $z \sim 1$. We have extracted a list of 150 strong lenses using the most recent CFHTLS data release via automated procedures.

Following our first SNAPSHOT proposal in cycle 15, we propose to continue the Hubble follow-up targeting a larger list of 130 lensing candidates. These are intermediate mass range candidates (between galaxies and clusters) that are selected in the redshift range of 0.2-1 with no a priori X-ray selection. The HST resolution is necessary for confirming the lensing candidates, accurate modeling of the lenses, and probing the total mass concentration in galaxy groups up to $z \sim 1$ with the largest unbiased sample available to date.

OBSERVING DESCRIPTION

we propose to conduct a SNAPSHOT follow-up of 130 lensing candidates found in the CFHT-LS survey or other similar ground-based observations. The lenses we are targetting are mainly intermediate mass range candidates (between galaxies and clusters) that are selected in the

redshift range of 0.2-1 with no a priori X-ray selection. The HST resolution is necessary for confirming the lensing candidates, accurate modeling of the lenses, and probing the total mass concentration in galaxy groups up to $z \sim 1$ with the largest unbiased sample available to date.

	Orbit Structure diagram for Orbit 1. The timeline shows the sequence of events over 5500 seconds. Key phases include: GS Acq (0-400s), three exposure periods (Exp. 1) each lasting 500s, separated by overhead periods, a final overhead period, a period of unused visibility (797s), and an occultation period. The diagram uses color coding: blue for acquisition, green for exposures, and red for overhead and occultation periods.
