### **ABSTRACT**

We propose to carry out a HST/WFPC2 survey of young brown dwarfs, Class I and Class II sources in the Chamaelon I region, one of the best-studied star-forming regions, in order to investigate the link between disk evolution and the formation of substellar-mass objects. We will use deep broad-band imaging in the I and z-equivalent HST bands to unveil the unknown population of substellar binary companions, down to a few Jupiter masses for separations of a few tens of AU. We will also perform narrow-band imaging to directly detect accreting circumstellar disks and jets around brown dwarfs, Class-I and class-II objects. Chamaelon I is nearly coeval of Orion (~1-2Myr) but at ~1/3 its distance, allowing 3x higher resolution and 10x more flux for comparable objects. Unlike Orion, low-mass objects and protoplanetary disks in Chamaeleon I have been extensively studied with Spitzer, but not yet with the HST. The Chamaeleon I region is an ideal HST target, as it lies in the CVZ of the HST and therefore it is easily accessible any time of the year with long orbits.

### **OBSERVING DESCRIPTION**

We will obtain WFPC2 images of 19 brown dwarfs in the Chamaeleon I star-forming region through the F791W and F850LP filters. These filters were selected because they provide the optimum combination of 1) high spatial resolution for resolving companions and circumstellar emission (at the shorter wavelength), 2) sensitivity to cool, red companions (at the longer wavelength), and 3) colors that discriminate cool companions from field stars. For targets with  $I > 17$ , we will obtain one CR-SPLIT 520 sec exposure in F791W and one CR-SPLIT 320 sec exposure in F850LP at each dither position with GAIN=7. For targets with  $I = 16.3-17$ , we will use the same exposure times, but

with GAIN=15 to prevent saturation. The long exposures will provide SN=3 for  $m_{791}=25.5$  and  $m_{850}=24.5$ , which corresponds to companions with masses of 3 MJup at the distance and age of the targets.

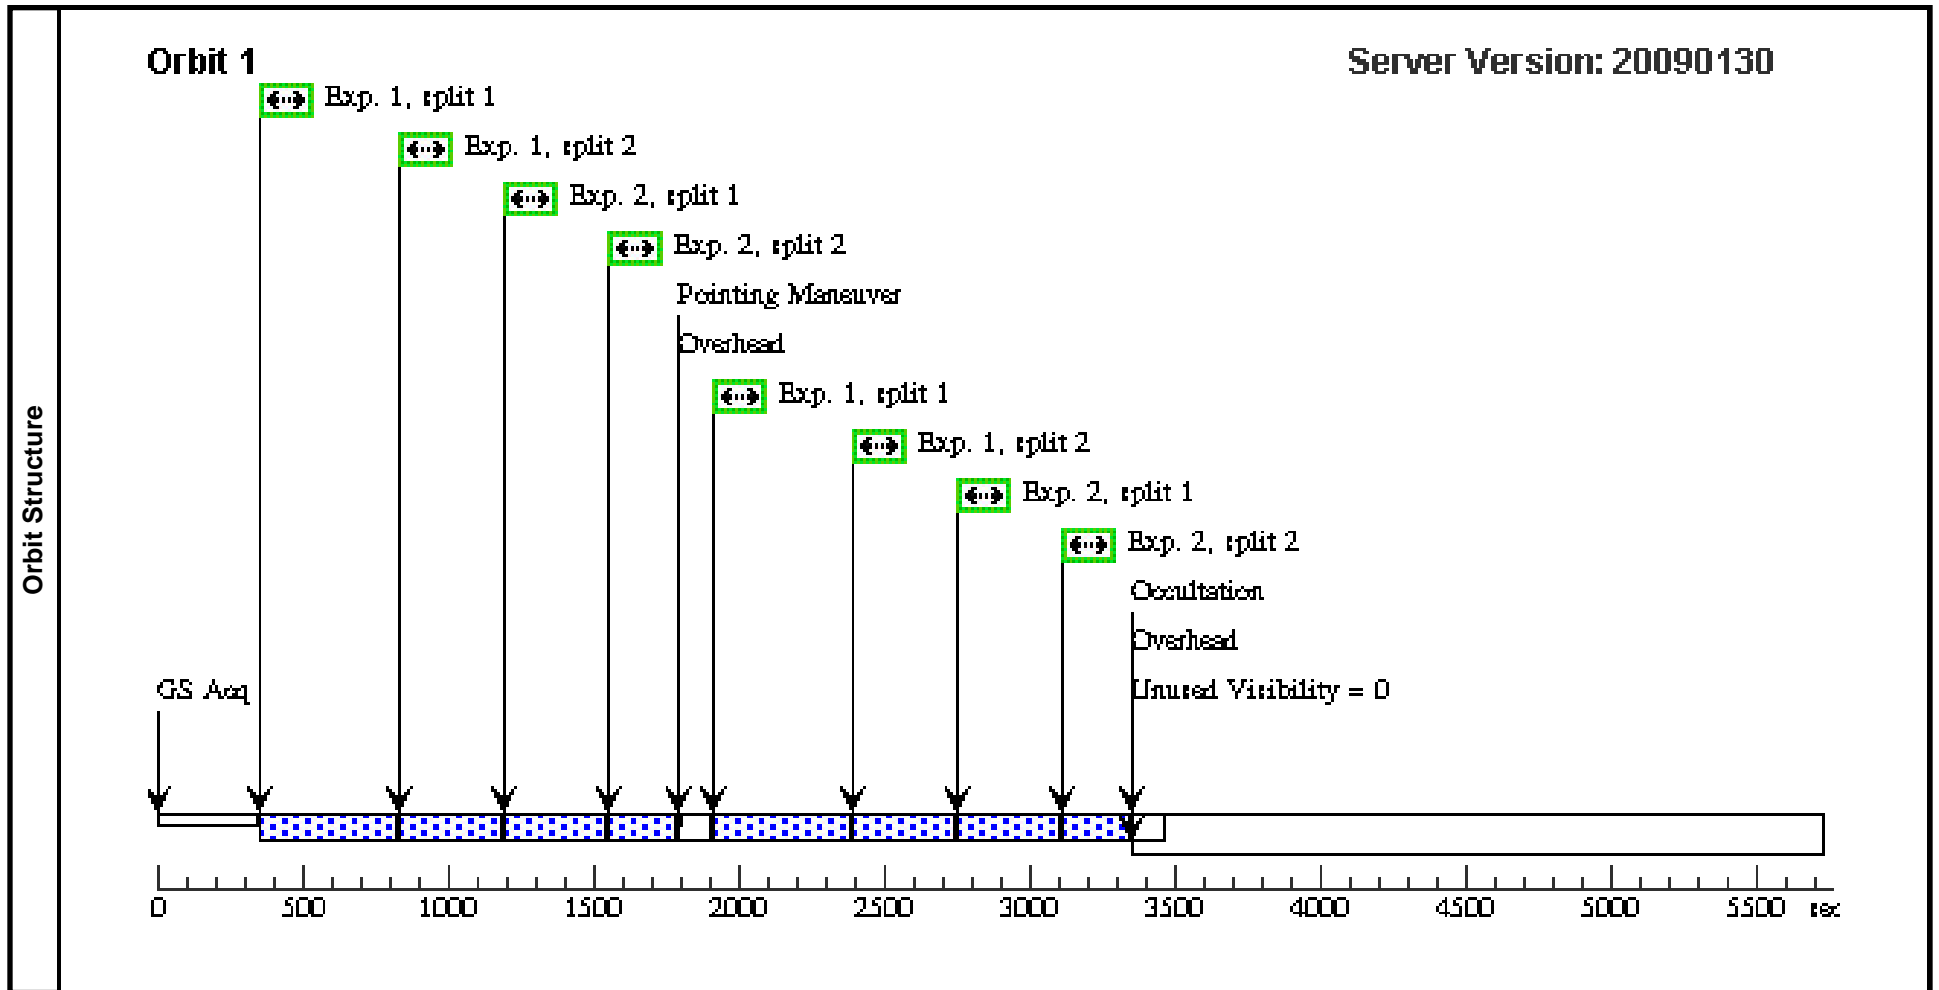

We also will obtain WFPC2 images of 56 disk-bearing stars in Chamaeleon I through the F547M, F656N, F631N, and F673N filters. For each narrowband filter the same exposure time is used for all targets while the exposure times for F547M are selected to avoid saturation of the targets.

Most targets will be centered at a position that is offset from the nominal center of PC1 with POS-TARG -7, -8 to place them near the readout amplifier, which will diminish the amount of lost or smeared charge in the final images. The only exceptions are 10 positions that are the midpoints between 2 stars so that both stars will appear within the PC. These positions will be centered in PC1. Each target will be observed with a two-point dither pattern (WFPC2-LINE) and one CR-SPLIT exposure at each dither position for each filter. Each target will be observed in one orbit and one visit. There are no scheduling constraints for this program.
