89 Total Orbits Used

ABSTRACT

The Cosmic Assembly Near-IR Deep Extragalactic Legacy Survey (CANDELS) is designed to document the first third of galactic evolution from $z = 8$ to 1.5 via deep imaging of more than 250,000 galaxies with WFC3/IR and ACS. It will also find the first Type Ia SNe beyond $z > 1.5$ and establish their accuracy as standard candles for cosmology. Five

premier multi-wavelength sky regions are selected from the Spitzer Extragalactic Deep Survey (SEDS) to provide complementary IRAC imaging data down to 26.5 AB mag, a unique resource for stellar masses at all redshifts. The use of widely separated fields mitigates cosmic variance and yields statistically robust and complete samples of galaxies down to 10^9 solar masses out to $z \sim 8$.

The program merges two originally separate MCT proposals. The Faber program incorporates a “Wide” imaging survey in three separate fields to ~ 2 orbit depth over ~ 0.2 sq. degrees, plus a “Deep” imaging survey to ~ 12 orbit depth in the two GOODS regions over ~ 0.04 sq. degrees. In combination with ultra-deep imaging from the Hubble Ultradeep Field program (GO 11563), the result is a three-tiered strategy that efficiently samples both bright/rare and faint/common extragalactic objects. The Ferguson program adds an extensive high-redshift Type Ia SNe search, plus ultraviolet “daytime” UVIS exposures in GOODS-N to exploit the CVZ opportunity in that field.

This program, GO 12064, is part of the Wide mosaic survey, which has the following field centers and sizes:

Field ID	RA(2000)	Dec(2000)	WFC3 Dim.	PA on sky
UDS	02 17 38	-05 12 02	4x11	270
COSMOS	10 00 31	+02 24 00	4x11	180
EGS	14 19 31	+52 54 10	3x15	41

Science highlights from the Wide program:

* Underlying structural properties of galaxies as revealed by

WFC3-IR images sensitive to older stars (beyond the 4000-A break) and less affected by dust than ACS. A key redshift is $z \sim 2$, where star-formation peaks, QSOs are most abundant, and where restframe B-band is still accessible to WFC3. Sample questions include:

- Structure in young vs. old stars: same or different?
- Disks -- do settled disks exist at $z \sim 2$? Radii, mass profiles, color gradients, flattenings
- Bulges -- how many have formed by $z \sim 2$, and in what galaxies? Bulge-disk ratios, radii, mass profiles, central stellar densities, environments
- Structure of highly reddened, dust-obscured galaxies
- Mergers and interactions: Gini/M20 and other measures of peculiarity and merger state
- AGN: where are accreting BHs found? Which formed first, bulges or BHs? Properties of AGN hosts. Search for obscured AGN point sources not visible at shorter wavelengths.
- * Census of rare, massive galaxies at $z \sim 2$, minimizing cosmic variance through the use of multiple Wide fields
- * Discovery and counts of rare luminous candidate galaxies at the top of the luminosity function at $z \sim 7-8$
- * Measurement of the correlation function and clustering of early galaxies to estimate dark-matter halo masses
- * Search for Type Ia SNe to $z \sim 2$, exploiting long-wavelength sensitivity of WFC3-IR. The first comprehensive search for Type Ia's at these large distances and early epochs

OBSERVING DESCRIPTION

Overview:

The CANDELS program in Cycle 18 includes:

GO 12060: Deep mosaic in GOODS-S: Y-band + one skirt epoch

GO 12061: Deep mosaic in GOODS-S: J+H, epochs 1-5 + 2 skirt epochs

GO 12062: Deep mosaic in GOODS-S: J+H, epochs 6-10

GO 12063: Wide mosaic in Extended Groth Strip (EGS)

GO 12064: Wide mosaic in UKIDSS/Ultradeep Survey (UDS)

Field maps and details are at <http://candels.ucolick.org>.

GO 12064 executes the Wide mosaic in UDS, which has 4x11 WFC3-IR tiles. Each tile is observed for 2 orbits, which are spaced 52 +/- 3 days apart to enable SNe search. Dates, ORIENTs, and the long-thin aspect ratio have all been chosen to maximize overlap of the ACS parallels on top of the WFC3 region. The location and orientation of the mosaic also maximize overlap with extensive multi-wavelength ancillary data in UDS, including the VLT redshift survey by Almaini et al.

Nominal WFC3 exposure times for the Wide program are 1/3 orbit in J (F125W) and 2/3 orbit in H (F160W) at each epoch, plus matching 1/3 orbit in V (F606W) and 2/3 orbit in I (F814W) for the ACS parallels. The larger FOV of ACS means that each location is covered by at least two ACS tiles, which doubles the *effective* ACS exposure times over those above. The expected 5-sigma depths in AB mags over most of the area are 27.0 (J), 27.1 (H), 28.7 (V), and 28.6 (I).

High-redshift SNe are discovered with J+H, but low-redshift interlopers and other SNe types must be rejected using shorter-wavelength ACS F606W exposures taken close in time. These ACS exposures should preferably be taken within 3 days of J+H, and a

minimum (effective) exposure time of 1300 s in ACS F606W is required.

This works for all but the easternmost three rows of the UDS mosaic, which are not covered by ACS. A short 434 s exposure with F350LP/UVIS is accordingly inserted into these J+H orbits for SNe interloper rejection. Roughly one supernova discovery is predicted in UDS.

Summary of 12064 observations:

Mosaic geometry:

- * The mosaic is oriented west-to-east to cover the redshift survey by Almaini et al.
- * The chosen mosaic overlap is 4%, which yields a minimum overlap of 1% (1.3") in the short direction to defend against estimated pointing errors of ~0.2-0.25"
- * The ORIENTs of individual tiles are held constant insofar as possible to create an unbroken mosaic. A few tiles have been rotated off-nominal in order to find guide stars. These tiles should be observed with the same ORIENTs and guide stars at both epochs, and the two epochs should be separated by 52 +/- 3 days just like the regular tiles (see SNe timing requirements below)
- * The third-easternmost rank of F350LP tiles is shifted by 18" relative to the parent WFC3-IR tiles towards the ACS area to improve short-wavelength coverage for SNe interloper rejection
- * The second epoch is offset by 4.0" southwest to bridge the "death star" in WFC3-IR and the ACS gap

Exposures:

- * Filters used: J = F125W, H = F160W, V = F606W, I = F814W
- * Nominal WFC3-IR exposure times per orbit: 1/3 orbit J, 2/3 orbit

H, each broken into two sub-exposures (in orbits where F350LP is taken, J and H must be more equal)

- * Matching ACS parallel exposure times per orbit: 1/3 orbit V, 2/3 orbit I, each broken into two sub-exposures and timed to match J and H
 - Due to the overlapping ACS FOV, the **effective** exposure times in ACS are roughly double these
- * Individual exposure times are adjusted to fit orbit visibility periods, allow for buffer dumps, and the need to use F350LP for tiles not covered by F606W parallels (for SNe rejection)
- * Dither pattern?
- * SNe search:
 - Combines all J and H exposures from each visit into a single image. Small-scale four-point dither treats them as part of same exposure, gives sub-pixel sampling
 - Overlapping ACS FOVs bring effective V exposure time per epoch to minimum 1300 s needed for SNe interloper rejection
 - F350LP is inserted into J+H exposure sequence when no contemporaneous ACS V parallel exists

Timing requirements:

- * Dates and ORIENTs are chosen to maximize ACS parallel overlap on top of the WFC3/IR region for both visits and also eliminate the swing of ACS relative to WFC3/IR between visits
 - The above is achieved if the entire mosaic at each epoch is fitted within the stated BETWEEN windows
- * Supernova timing and schedule requirements:
 - 1) Each WFC3 tile in Epoch 1 is paired with the same tile in Epoch 2, and the two tiles are compared to find SNe. Visit

2 should occur after Visit 1 by 52 +/- 3 days

- 2) Most WFC3-IR tiles depend on having *contemporaneous* ACS F606W parallels for SNe rejection. The parallels are linked in ranks such that the first rank of WFC3 tiles provides the parallels for the fourth rank of WFC3 tiles, etc. Matching ACS F606W exposures should preferably be taken within 3 days of J+H
- 3) For guide star purposes, the array should be observed from east to west

* The overall dates of observation are flexible as long as the above relative timings and chosen ORIENTs are obeyed

* FURTHER INSTRUCTIONS AND A DIAGRAM OF TILE VISIT ID'S TO AID IN SCHEDULING HAS BEEN GIVEN TO TRICIA ROYLE. PLEASE GET A COPY OF THESE INSTRUCTIONS.

ADDITIONAL COMMENTS

Order and pace of observing the array:

* To aid in scheduling, we have drawn up illustrations labeling each WFC3-IR tile with its visit number at the two epochs in Cycle 18. These should help in maintaining the required epoch difference of 52 +/- 3 days for each tile as well as the required time difference of <3 days between a WFC3-IR tile and its ACS parallel. The array should be observed from east to west. Other tips are also included in the instructions. Tricia Royle has a copy of these instructions. PLEASE GET A COPY.

Guide stars:

* Guide stars have been pre-screened. Any use of "SINGLES" is approved by the PI.

Bright objects -- persistence:

- * The J and H exposures will be pushed to the deepest possible limiting magnitude. Please do not schedule bright objects (like star clusters) in the 8?-orbit window before our observations
