

# 12893 - Study of Small and Cool Kepler Planet Candidates with High Resolution

## Imaging

Cycle: 20, Proposal Category: SNAP

(Availability Mode: SUPPORTED)

### INVESTIGATORS

<i>Name</i>	<i>Institution</i>	<i>E-Mail</i>
<b>Dr. Ronald L Gilliland (PI) (Contact)</b>	<b>The Pennsylvania State University</b>	<b>rlg27@psu.edu</b>
Dr. Jason T Wright (CoI)	The Pennsylvania State University	jtwright@astro.psu.edu
Dr. David R. Ciardi (CoI)	California Institute of Technology	ciardi@ipac.caltech.edu
Dr. Elisabeth R. Adams (CoI)	Smithsonian Institution Astrophysical Observatory	eadams@cfa.harvard.edu
Dr. Natalie Batalha (CoI)	NASA Ames Research Center	natalie.m.batalha@nasa.gov
Mr. William J. Borucki (CoI)	NASA Ames Research Center	wborucki@mail.arc.nasa.gov
Dr. Timothy Brown (CoI)	Las Cumbres Observatory Global Telescope Network	tbrown@lco.net
Prof. David Charbonneau (CoI)	Harvard University	dcharbonneau@cfa.harvard.edu
Dr. Jean-Michel Desert (CoI)	California Institute of Technology	jdesert@cfa.harvard.edu
Dr. Andrea Dupree (CoI)	Smithsonian Institution Astrophysical Observatory	dupree@cfa.harvard.edu
Dr. Francois Fressin (CoI)	Harvard University	ffressin@cfa.harvard.edu
Dr. Nick Gautier (CoI)	Jet Propulsion Laboratory	nick@ipac.caltech.edu
Dr. Matthew Holman (CoI)	Smithsonian Institution Astrophysical Observatory	mholman@cfa.harvard.edu
Dr. Jon Jenkins (CoI)	SETI Institute	jon.jenkins@nasa.gov
Dr. Paul Kalas (CoI)	University of California - Berkeley	kalas@astron.berkeley.edu
Dr. David W. Latham (CoI)	Smithsonian Institution Astrophysical Observatory	latham@cfa.harvard.edu
Dr. Jack J. Lissauer (CoI)	NASA Ames Research Center	jack.j.lissauer@nasa.gov
Dr. Geoff Marcy (CoI)	University of California - Berkeley	gmarcy@etoile.berkeley.edu
Dr. Jason F Rowe (CoI)	NASA Ames Research Center	jason.rowe@nasa.gov
Dr. Guillermo Torres (CoI)	Smithsonian Institution Astrophysical Observatory	gtorres@cfa.harvard.edu

158 Total Orbits Used

## **ABSTRACT**

The Kepler Mission was launched three years ago. Well over 2000 planet candidates have now been published. Many of these have small radii, even sub-Earth. Many of the candidates have orbits sufficiently large to place the candidates in the Habitable Zone (HZ) where liquid water could exist. These two aspects together, small and cool, are still rare, but rapidly improving.

The prime mission of Kepler is to detect true Earth analogs, i.e. Earth-size planets in year-long orbits of solar-like stars. Although we have not yet observed long enough to detect Earth analogs, there are now candidates orbiting K-M spectral type host stars that are nominally in the HZ. Current radial velocity precision does not come close to allowing the direct confirmation of Earth analogs, thus we must turn to other approaches to validate these Kepler discoveries. This program provides critical supporting information on the best (small planets, long periods, multiplicity of transiting objects) candidates that have already passed all of the validation steps available from the Kepler data, and for which HST imaging is

demonstrably superior to ground-based AO. Imaging also enables reliable planet sizes by providing knowledge of diluting objects in the field. In particular these high resolution imaging observations directly address the difficult problem of thoroughly eliminating, or clearly identifying, false positives due to a blended background eclipsing binary along the line-of-sight as the source of apparent transits. These observations will allow us to validate many 10s of SuperEarth-sized and smaller planets, vastly increasing the number of confirmed small planets.

### **OBSERVING DESCRIPTION**

The exposure sets for each of the 158 SNAP targets will be identical in form. Total orbit lengths are 23 (min), 29 (median), 39 (max) minutes. Each visit is schedulable throughout the year, no solar blockage.

A change introduced on 20 July 2012 is to add post-flashes throughout that will bring all exposures to 12 e-. (I assume a 20% vignetting in the C amp corner, therefore specify FLASH=14.0 for shortest exposures.) If FLASH will be less than 3.0, I do not set this. Testing indicates that the total visit lengths increase by 63 seconds compared to the no.s quoted above.

V magnitudes have been computed from the native Sloan bandpasses available in the Kepler Input Catalog with  $V = g - 0.5784*(g-r) - 0.0038$  (<http://www.sdss.org/dr5/algorithms/sdssUBVRITransform.html>)

I (Cousins) set as:  $I_c = r - 1.2444*(r-i) - 0.382$ . g, r, i are taken from the MAST compilation of SDSS filter mags for KIC stars.

Exposure times were calculated with the WFC3 ETC using V input for F555W, and  $I_c$  for F775W and the appropriate underlying spectral type which for these stars is most often K V, ranging from late G to mid-M.

At the start of the orbit, four exposures using the WFC3-UVIS-DITHER-BOX pattern

for sub-pixel sampling of the PSF will be taken using F555W.

The exposures will use the 1024x1024 subarray (UVIS2-C1K1-SUB) spanning 40 arcsec, as was used for the single orbit test observations used for Fig. 1 (Gilliland & Rajan 2011, WFC3 ISR2011-3).

Exposure times will range from 6.6 s for the brightest target to 77 s for the faintest providing in each case a brightest pixel at 90% of saturation -- if centered on a pixel.

One additional exposure will be taken in which the longer exposure time equals 50% more than the sum of the unsaturated exposures -- providing modest saturation. The saturated exposure contributes to the S/N everywhere outside of about 0.1 arcsec. (Gilliland & Rajan 2011 used one longer exposure at 100% more than the sum of the other 4, this approach will be 0.1 mag shallower, still delta-mag well above 10 outside of 2 arcsec and have better cosmic ray elimination relative to the test.)

Next, a similar set of 4 exposures using the WFC3-UVIS-DITHER-BOX will be taken with F775W, again to 90% of saturation. Again, one longer exposure will also be obtained.

KIC-11462341 at  $V = 14.76$ ,  $V-I_c = 1.498$  will use 13.8 and 13.7 s exposures in F555W and F775W reaching 90% of saturation, with added long exposures of 82.6 and 82.2 sec. This will use 24 minutes inclusive of GS Acq. Our median magnitude is  $V = 15.2$  taking 29 minutes. Even at this level orbit use primarily goes to overheads, not exposure time. For the 18 targets at  $V > 16.0$  the long exposures will be limited to 300 s, keeping maximum SNAP visit length to under 40 minutes. These faintest hosts are all M-dwarfs. The transits for these faint cases even for Earth-sized

planets are much deeper than the canonical 0.0001, therefore slightly shallower limits will remain more than adequate. Indeed, all of our exposures will be deeper than needed, but with total time use limited by overheads no significant decrease of observing time is possible by squeezing exposure times -- given the desire to have 5 well dithered exposures to co-add and very robustly eliminate cosmic rays.

This filter pair was selected to be within the Kepler bandpass, and with a large wavelength separation. We will use all available observation sets to derive an empirical transformation from the HST pair to the Kepler magnitude system. We expect to obtain the brightness to better than about 2% systematic error for companions in the native system.
