ABSTRACT

Recent simulations and observations indicate that the majority of O VI and Ne VIII absorption-line systems originate in the halos of galaxies. These systems therefore provide a unique probe of the circumgalactic medium. The study of these warm baryons is a major component of the COS mission and already over one hundred QSOs have been targetted with COS for such studies. However, a complete understanding of these systems is only

possible with detailed studies of the galaxies associated with the absorbers. Ground-based spectroscopic surveys of the galaxies around COS QSOs are on-going by our team and others. Missing from these studies, however, is morphological information on the absorbing galaxies. Given the redshifts of the COS O VI and Ne VIII systems, only HST can provide the spatial resolution needed for such morphological studies. Here, we propose a snapshot imaging survey using ACS/WFC of the fields around COS QSOs to obtain morphologies of COS-discovered O VI and Ne VIII systems. Our survey will add significantly to the legacy of the COS observations by allowing a more complete understanding of the galaxies responsible for the absorption. We waive the proprietary period on these observations so COS GOs can take full advantage of the imaging data for their own analysis.

OBSERVING DESCRIPTION

As we are interested in studying the optical morphologies of the absorbing galaxies and want to cover as large an area around the QSO as possible, we will use the ACS/WFC. To provide the most accurate comparison to local morphology studies and obtain optimal signal-to-noise for these intermediate-redshift galaxies, we will observe them with the F814W filter which samples rest-frame optical light in this redshift range. From our previous work studying global morphologies and recent interactions in distant group galaxies (Mulchaey et al. 2006; Wilman et al. 2009), we conservatively estimate that we require a S/N of 5 to reliably study galaxy morphologies. According to the ETC, we can reach $F814W = 23.5$ mag arcsec-squared at $S/N = 5$ over a 2×2 box in 1800 sec. This corresponds to a total magnitude $F814W = 26$ mag at $S/N = 5$. We will use a three-point dither to improve the sampling of the point-spread function.

Proposal 13024 - Visit 01 - A Public Snapshot Survey of Galaxies Associated with O VI and Ne VIII Absorbers

Tue Dec 11 02:57:07 GMT 2012
