144 Total Orbits Used

ABSTRACT

Deep HST imaging has shown that the overall star formation density and UV light density at $z > 3$ is dominated by faint, blue galaxies. Remarkably, very little is known about the equivalent galaxy population at lower redshifts. Understanding how these galaxies evolve across the epoch of peak cosmic star-formation is key to a complete picture of galaxy evolution. While we and others have been making every effort to use existing UV imaging data, a large fraction of the prior data were taken without post-flash and are not photometric. We now propose to obtain a robust legacy dataset for a complete census of faint star-forming galaxies at $z \sim 0.5-2$, akin to what is achieved at $z > 3$, using the unique capabilities of the WFC3/UVIS camera to obtain very deep UV imaging to 27.5-28.0 mag over the CANDELS Deep fields in GOODS North and South. We directly sample the FUV at $z > \sim 0.5$ and we make these prime legacy fields for JWST with unique and essential UV/blue HST coverage. Together with the exquisite ancillary multi-wavelength data at high spatial resolution from ACS and WFC3/IR our program will result in accurate photometric redshifts for very faint sources and will enable a wealth of research by the community. This includes tracing the evolution of the FUV luminosity function over the peak of the star formation rate density from $z \sim 3$ down to $z \sim 0.5$, measuring the physical properties of sub- L^* galaxies, and characterizing resolved stellar populations to decipher the build-up of the Hubble sequence from sub-galactic clumps. The lack of a future UV space telescope makes the acquisition of such legacy data imperative for the JWST era and beyond.

OBSERVING DESCRIPTION

This program is to obtain a legacy UV imaging dataset over the two CANDELS-Deep/GOODS fields. The survey builds on existing data and will obtain 8 pointings in GOODS-North and 5 pointings in GOODS-S. Over GOODS-North, we will make use of CVZ orbits to double our efficiency and observe in the UV during the bright part of the orbits.

The orbit structure over the two fields are explained below:

GOODS-South:

4 visits are submitted for each of the 5 pointings

- 1) 4 orbit visit F275W imaging
- 2) 5 orbit visit F275W
- 3) 4 orbit visit F336W
- 4) 4 orbit visit F336W

(The last pointing in GOODS-S consists only of 4x4 orbit visits.)

GOODS-North:

Initially 2 visits were submitted for each of the 8 pointings

- 1) 3 orbit visit with 4 exposures F275W, and 2 exposures F336W
- 2) 3 orbit visit with 6 exposures F336W

This setup was used for the first CVZ opportunity (pointings 2+3). For all other pointings, we use 3 2-orbit visits to allow for more scheduling flexibility.

- 1) 2-orbit visit with 4 exposures F275W
- 2) 2-orbit visit with 4 exposures F336W
- 3) 2-orbit visit with 4 exposures F336W

Exposure Times:

We use full orbit exposures, which limits the amount of extra post-flash background needed and readnoise, and increases the final image depth. We will have 8 or more exposures per pointing, which will allow us to remove the significant number of cosmic rays for these long exposures.

Post-Flash:

Post-flash is used to improve the charge transfer efficiency, as suggested by STScI. For full orbit exposures, we expect already ~ 4 e⁻ from dark current, but we still add 10e⁻ for F275W (where the background is very low), and 6e⁻ to F336W exposures. This will ensure that the minimum background level of 12e⁻ per pixel is met across the full detector.

Dithering:

The GOODS-S observations use a 4 point dither pattern which steps across the gap within each visit. For GOODS-N, we use the standard 4 point dither box for UVIS images together with a POS-TARG offset of ~ 4 arcsec to step across the chip gap and to improve the background (following GO-13389, PI Siana) in addition to the standard UVIS line dither.

ACS Parallels:

In parallel to all WFC3/UVIS exposures, we take ACS/WFC parallel imaging in F435W. These exposures are split in 2 per orbit.

Orients:

The GOODS-N observations which make use of CVZ opportunities should all be taken at the same orient.

The observations in GOODS-S will be taken in two different epochs, with orients different by ± 90 deg to provide further control on CTE loss.

Alternative pointings:

To increase scheduling flexibility and make use of additional CVZ opportunities, we increase the allowable orient ranges for GOODS-N pointings 4 and 5. These visits need slightly different pointing centers, and they are therefore duplicated with individual targets UVLF-NORTH-4 or UVLF-NORTH-4ALT, respectively (visits: GN-4-V* vs GN-4alt-V*).
