12 Total Orbits Used

ABSTRACT

In two recent analyses of Hubble data, we discovered that both Makemake (the second-brightest trans-Neptunian Object behind only Pluto) and 2007 OR10 (the third largest TNO behind only Pluto and Eris) each have a faint satellite in orbit about them. With the addition of these satellites, all known TNOs with diameters unequivocally larger than 1000 km are known to have moons; these are the only two for which the satellite orbits have not been characterized. The presence of these satellites provides the opportunity to accurately characterize bulk properties of Makemake and 2007 OR10 for the first time, including their masses and densities. This is a remarkable opportunity to study two of the largest dwarf planets in the solar system, completing the census of bulk properties for TNOs with $D > 1000$ km. Hubble has been instrumental in characterizing the satellites of the other TNO dwarf planets, as its union of sensitivity and angular resolution make it uniquely capable of studying these faint, high-contrast systems. We request an 18-orbit program to accurately measure the orbital properties of these satellites and to derive the masses and densities of Makemake and 2007 OR10. Both Makemake and 2007 OR10 are targets of JWST Guaranteed Time Observations, and this HST program is required to provide orbital phasing information that will ensure that the JWST MIRI observations can resolve the systems.

OBSERVING DESCRIPTION

All visits will follow the same basic pattern, with small variations depending on the choice of filters. This pattern will be to start the visit with several short F350LP exposures followed by several longer exposures in a second filter after which we will repeat the F350LP exposures to finish the visit. The bracketing F350LP exposures will provide a baseline to correct for any possible lightcurve effects and allow us to work on one wide-band filter (F606W or F814W) at a time in the visits.

MK2: The initial set will be guided by the large acceptable orbit volume from Parker et al. (2016b) until there is sufficient new data to generate an preliminary orbit. Until these are done we cannot know with certainty if any given scheduled observation will detect MK2. According to our simulations, at least four out of seven visits are expected to be successful, we just cannot know which visits in advance. Also, success with this minimal number of orbits requires that they be scheduled over a short enough time range (~21 days) that the timing of all seven have to be decided at once and there can be no feedback to improve our odds. The successful observations will then be sufficient to get an initial orbit that will permit us to predict the location of MK2 during the rest of Cycle 25 and 26. After the first group are executed, the results will be collated into an orbit model. From that orbit will determine the most effective time to schedule the remaining visits for maximum orbit improvement in the remainder of Cycle 25 and/or Cycle 26. If the satellite is not recovered in these initial seven orbits, the subsequent four orbits can be re-allocated to other programs.

OR2: The discovery observations of OR2 do not suggest an orbit that spends a large fraction of its time at separations from the primary that would preclude detection. Thus, only three initial recovery observations are planned for OR2, which combined with the previous measurements will inform the four characterization orbits. If the satellite is not recovered in these initial three orbits, the subsequent four orbits can be re-allocated to other programs.

Proposal 15207 - Makemake Recovery 01 (01) - The Moons of Kuiper Belt Dwarf Planets Makemake and 2007 OR10

Tue May 08 00:05:08 GMT 2018

Visit	Proposal 15207, Makemake Recovery 01 (01), completed Diagnostic Status: No Diagnostics Scientific Instruments: WFC3/UVIS Special Requirements: PCS MODE FINE <i>Comments: This is a time-sensitive program measuring the orbital properties of Makemake's satellite. This observation should be executed as early as possible in Cycle 25, to ensure that the subsequent characterization observations can be optimally scheduled later in the cycle.</i>

Proposal 15207 - Makemake Characterize 01 (08) - The Moons of Kuiper Belt Dwarf Planets Makemake and 2007 OR10

Tue May 08 00:05:09 GMT 2018

Visit	<p>Proposal 15207, Makemake Characterize 01 (08), implementation</p> <p>Diagnostic Status: No Diagnostics</p> <p>Scientific Instruments: WFC3/UVIS</p> <p>Special Requirements: PCS MODE FINE; AFTER 07 BY 60.0 D TO 365.0 D; ON HOLD FOR 07</p> <p><i>Comments: The timing for this observation cannot be scheduled until all Makemake 'recovery' observations have been executed.</i></p> <p><i>NOTE that this has been changed to 814W from 606W. This is because of previous observation failures. We have recieved no useful 814W data at this point, and must recover it. If this observation can be executed as 814W, we may be able to avoid the need for a hopper.</i></p> <p><i>On Hold Comments: This is an observation that will be optimally scheduled after the Makemake recovery observations.</i></p>
