293 Total Orbits Used

ABSTRACT

We propose SNAP UVIS+IR imaging of 293 SPT galaxy clusters at $0.2 < z < 1.5$, carefully selected from the SPT cluster catalog of more than 500 systems identified via the Sunyaev-Zel'dovich effect. The SPT clusters are a uniquely powerful resource in cluster research, being the only large sample of massive clusters spanning the entire redshift range over which such systems exist, with more than equal mass sensitivity at the highest redshifts compared to low redshift ($z < 0.5$) systems. Using the F200LP+F110W ultra-broadband filters, our proposed SNAP data achieve maximal depth and redshift grasp in minimal time for a wide range of galaxy types: from red-and-dead galaxies in the cluster red sequence over the entire sample redshift range, star forming galaxies over the same range, and even starburst galaxies at yet higher redshifts, lensed in the cluster backgrounds. We envision three motivating science programs - all enabled for the first time over this unprecedented redshift range for massive clusters: 1) the evolution of brightest cluster galaxies through both wet and dry mergers, 2) strong lensing statistics and mass-concentration of strong lensing clusters, and 3) the X-ray-selected AGN content in clusters. These data will have a lasting legacy, and cap an extensive array of other data (both ground- and space-based, from X-ray to radio wavelengths) on these clusters. The proposed data, at a fiducial SNAP completion rate of 33%, will more than double the total number of SPT clusters with HST imaging, and add WFC3-IR imaging for a large sample for the first time, which is of particular importance to any studies of galaxy populations in these distant clusters.

OBSERVING DESCRIPTION

SNAP observations of a total of 293 SPT galaxy clusters. Observations use WFC3 IR+UVIS to do two bands in a single shortened SNAP orbit. Filters are F200LP in UVIS and F110W in IR, to optimize throughout in short orbits. Clusters are configured to have one of three total exposure lengths (short, medium, long) depending on cluster redshift: i.e. there are only three unique template observations.
