153 Total Orbits Used

ABSTRACT

Roughly 75% of known galaxies confirmed or suspected to lie within 10 Mpc have been observed by HST sufficiently to resolve the brightest stars, build a color-magnitude diagram, and determine a distance from the magnitude of the tip of the red giant branch. It would take observations of 153 additional targets to have a complete sample of ALL suspected galaxies within 10 Mpc. The necessary information can be acquired at the rate of one orbit per candidate. A complete sample would provide a valuable archival record of the vast majority of stars within 10 Mpc with $M_I < -3$. There would be information on the stellar content of all manner of galaxies, in all manner of environments. There would be robust constitution of groups.

There would be clear definition of local structure and flows. A snap program will not in itself result in completion of such a sample but it gives a way forward toward the ultimate goal with minimal impact on HST resources.

OBSERVING DESCRIPTION

All observations in this snap proposal will be observed in a similar manner.

Observations are with ACS/WF with time split evenly between the F606W and F814W filters in a single orbit. The observations within a filter are split into 2 equal, dithered exposures.

There are no orientation restrictions.
