

## 16241 - A NUV Snapshot Survey of the Nearest Luminous AGN

Cycle: 28, Proposal Category: SNAP

(Availability Mode: SUPPORTED)

### INVESTIGATORS

<i>Name</i>	<i>Institution</i>	<i>E-Mail</i>
<b>Dr. Michael J Koss (PI) (Contact)</b>	<b>Eureka Scientific Inc.</b>	<b>mike.koss@eurekasci.com</b>
Dr. Benny Trakhtenbrot (CoI)	Tel Aviv University	benny.trakht@gmail.com
Dr. Richard Mushotzky (CoI)	University of Maryland	richard@astro.umd.edu
Prof. Claudio Ricci (CoI)	Diego Portales University	claudio.ricci.astro@gmail.com
Dr. Aaron J. Barth (CoI)	University of California - Irvine	barth@uci.edu
Dr. Nathan Secrest (CoI)	United States Naval Observatory	nathansecrest@msn.com
Dr. Henrique R. Schmitt (CoI)	Naval Research Laboratory	henrique.schmitt@nrl.navy.mil

### VISITS

## **ABSTRACT**

Nearby powerful AGN provide the best way to understand the growth of supermassive black holes and their effect on galaxies. The Swift-BAT 105-month survey, with its all-sky coverage that is insensitive to obscuration up to Compton-thick levels, provides the largest, most complete sample of local ( $z < 0.1$ ) powerful AGN. These AGN have similar luminosities to the distant AGN typically found in deep, pencil-beam Chandra surveys and are thus a critical nearby template for luminous high-redshift AGN. Despite containing the most luminous nearby AGN, only five have been imaged in the NUV. We propose a snapshot (SNAP) near UV survey (NUV,  $< 3000\text{\AA}$ ) in the F225W filter of the 124 nearest and X-ray brightest AGN with black hole mass measurements from broad line H $\beta$  with existing V or I-band HST imaging. These sources only have NUV imaging with Swift/UVOT or XMM-Newton/OM where the spatial-resolution is 30x coarser and thus nuclear star formation and PSF emission are impossible to accurately separate. These  $\sim 100$  pc resolution observations will resolve the power output of local AGN and study the link of nuclear star formation

## **OBSERVING DESCRIPTION**

This is a SNAP near UV survey (NUV,  $<3000 \text{ \AA}$ ) in the F225W filter of the 124 nearest ( $z < 0.1$ ) and X-ray brightest AGN with black hole mass measurements from broad line H $\beta$  with existing V or I-band HST imaging. These 100 pc resolution observations will resolve the power output of local AGN (point source emission in HST) and study the link of extended nuclear star formation with AGN activity. We will separate the point like AGN emission from the faint diffuse extended galaxy emission from SFR and measure its flux. These HST observations will be complemented by approved Swift/XRT and Swift/UVOT observations for broadband simultaneous SED coverage. Our observing strategy is to: 1) Obtain a short 20s sub arrayed exposure, to avoid target saturation. The median brightness is 17 mag AB in GALEX/NUV, with some brighter, and we don't know actually how bright the nucleus is compared to the host galaxy. 2) Then obtain a longer exposure of 17.5 minutes total so that we can recover and measure the extended emission. We split the longer 3 exposures into 350 seconds so the buffer dump can be put into the next exposure (need to be  $>349 \text{ s}$ ). We use 3 separate exposure for cosmic ray elimination and to sample the PSF. We target at UVIS2 to take advantage of the better UV sensitivity. We have set the flash to max (25e) to limit CTE, since the background is so low in the UV (like 1e from the ETC).

Proposal 16241 - Visit 01 - A NUV Snapshot Survey of the Nearest Luminous AGN
