ABSTRACT

This UVIS daily monitor program obtains full-frame, four-amp readout bias and dark frames. All exposures are post-flashed at a 20 e-/pixel level; a separate program (16569) will be used to obtain un-flashed UVIS darks to monitor non-postflashed behavior. The biases and darks from this proposal, in addition to those that are obtained as part of the WFC3/UVIS anneal program (16564), will be used to create superbias and superdark calibration reference files for the Calibration Reference Data System (CRDS) and monitor the evolution of hot pixels, dark current, bias level and readnoise.

This is the first of three daily monitoring programs of Cycle 29 (the others are 16567 and 16568). It covers November 15th, 2021 through March 18th, 2022. The combination of the three programs provides full coverage of Cycle 29.

OBSERVING DESCRIPTION

Full-frame, four-amp readout bias and dark frames are acquired daily (during SAA-free passages) in a repeating four-day cycle:

Day 1:

Visit 1: Flashed biases on each shutter, and one 900s flashed dark

Visit 2: 2 x 900s flashed darks

Day 2:

Visit 1: 2 x 900s flashed darks

Visit 2: 2 x 900s flashed darks

Day 3:

Visit 1: 2 x 900s flashed darks

Day 4:

Visit 1: 2 x 900s flashed darks

Visit 2: 2 x 900s flashed darks

Each dark frame employs a post-flash at a 20 e-/pixel level. All non-Day-1-Visit-1 darks use "no-move" darks (i.e. TARGNAME=DARK-NM) in which the Channel Select Mechanism (CSM) is not moved to the IR position and a narrow-band filter configuration is employed to reduce any scattered light. Since Day-1-Visit-1 Visits start with biases, and thus the CSM is in the IR position, these darks do not have to be "no-move" nor does a narrow filter have to be employed. Several different filters are used in order to distribute usage across multiple wheels thereby avoiding overuse of any particular wheel. The filters are:

F280N
F390M
F547M
F373N
F467M
F410M
F631N
F487N
F502N
F469N
F343N

Because there are two shutter blades, we use special commanding (config=S/C, target=DARK, mode=DATA, no spectral element, and exposure time = 4.0 Seconds) to

toggle the shutter from A to B. We take 0.5 second dark exposures for bias measurements because the Flight Software does not allow post-flashed 0-sec bias exposures.

The dark frames serve as a daily monitor of the location and evolution of warm/hot pixels. The bias exposures will be used to monitor the readnoise, which is measured from the overscan regions of the individual bias frames as well as from science pixel areas from bias-pair difference images. The bias and dark images will be combined into superbias and superdark calibration reference files, respectively, and delivered to CRDS.

The WFC3/UVIS anneal program (16564) acquires an independent set of bias and dark frames immediately before and after each anneal. It is important to note that data from program 16564 takes precedence over this program (i.e. no visits from this program should be executed during or immediately before/after the anneal.) Also, all visits from this program must occur during SAA-free epochs.
