18 Total Orbits Used

ABSTRACT

This proposal acquires data to monitor relative changes in the UVIS photometric throughput using scanned observations. Traditionally, this program looks for the presence of contaminants on the optics via the flux of standard stars as a function of time and wavelength. Additional filters have been added to monitor sensitivity losses at longer wavelengths. Staring mode exposures are obtained via the Photometry Monitor program.

OBSERVING DESCRIPTION

Each visit obtains scanned subarray observations of HST standards in both amps A and C through a subset of filters. The white dwarf GRW+70D5824 has been used for past monitors and will be continued. A second white dwarf (GD153) was added in Cycle 23 with equal weight. The latter target has an added benefit of being schedulable throughout the year in 1-Gyro mode. The monitor cadence is deliberately not tied to any of the monthly anneals but rather, the visits are spread as evenly as possible throughout the cycle. P330E, a solar-type spectrophotometric standard, was added in Cy27 to provide a check for color effects. Given the greater precision of the scanned mode (~3-5x improved over staring mode), scanned data may be used for computing the absolute photometric zeropoints as well as quantifying relative throughput changes.

Total number of orbits is 12: 10 orbits for two white dwarfs (GRW+70, GD153) (5 one-orbit visits for each star, spread throughout the year) + 2 orbits for a G-star (P330E), one orbit twice a year.

Proposal 16580 - P330E - iteration 1 (01) - WFC3 UVIS Time Dependent Sensitivity
