

16657 - Late-time NUV Snapshots of the Lost Envelopes of Stripped Supernovae

Cycle: 29, Proposal Category: SNAP

(Availability Mode: SUPPORTED)

INVESTIGATORS

<i>Name</i>	<i>Institution</i>	<i>E-Mail</i>
Dr. Christoffer Fremling (PI) (Contact)	California Institute of Technology	fremling@caltech.edu
Dr. Lin Yan (CoI)	California Institute of Technology	lyan@caltech.edu
Dr. Daniel Perley (CoI) (ESA Member)	Liverpool John Moores University	d.a.perley@ljmu.ac.uk
Dr. Jesper Sollerman (CoI) (ESA Member)	Stockholm University	jesper@astro.su.se
Dr. Ragnhild Lunnan (CoI) (ESA Member)	Stockholm University	ragnhild.lunnan@astro.su.se
Dr. Steve Schulze (CoI) (ESA Member)	Stockholm University	steve.schulze@fysik.su.se
Prof. Avishay Gal-Yam (CoI)	Weizmann Institute of Science	avishay.gal-yam@weizmann.ac.il
Dr. Ting-Wan Chen (CoI) (ESA Member)	Stockholm University	janet.chen@astro.su.se
Ms. Yuhan Yao (CoI)	California Institute of Technology	yyao@astro.caltech.edu
Dr. Eran O. Ofek (CoI)	Weizmann Institute of Science	eran@astro.caltech.edu
Prof. Claes Fransson (CoI) (ESA Member)	Stockholm University	claes@astro.su.se
Yashvi Sharma (CoI)	California Institute of Technology	yssharma@caltech.edu
Dr. Mansi Kasliwal (CoI)	California Institute of Technology	mansi@astro.caltech.edu
Dr. Niharika Sravan (CoI)	California Institute of Technology	niharika.sravan@gmail.com

163 Total Orbits Used

ABSTRACT

We propose a snapshot program to determine the occurrence rate of interaction between circumstellar material (CSM) and the ejecta of stripped supernovae (SNe Iib, Ib, Ic, SLSNe-I) using NUV imaging at >1 year after explosion. Large amounts of CSM must have been ejected by the progenitors to these SNe, so the potential for significant CSM interaction is present. However, only in very few cases have interaction signatures been identified using ground-based observations. In these cases we see H emission in late-time spectra created by the ejecta crashing into H-rich material. The reason interaction signatures are rare could be because the bulk of envelope material is ejected a very long time before explosion, or because it is unknown how or if CSM interaction with H-poor material would appear in the optical. A systematic survey in the NUV will be able to identify NUV excess from interaction regardless of the CSM composition. NUV emission from CSM has been identified in SNe Ia, but no late-time NUV survey has been carried out for stripped SNe. This NUV snapshot program targets an untargeted sample of 163 stripped SNe, and requires on average only a 30 minute duration visit per target. NUV imaging will constrain the prevalence, radius, mass and composition of CSM around stripped SNe, and will offer novel constraints on both single- and binary-star models for stripped SNe.

OBSERVING DESCRIPTION

Proposal 16657 (STScI Edit Number: 0, Created: Tuesday, September 13, 2022 at 10:04:30 AM Eastern Standard Time) - Overview

This is a snapshot proposal. Our goal is to identify point-like UV emission at the locations of stripped-envelope SNe which may be the result of the SN shocks running into the previously ejected outer envelopes of the progenitor stars to these SNe. For each of our SNe at $z < 0.15$ we require one visit, which consists of a 20 minute total exposure with WFC3/UVIS F275W, to reach a depth of ~ 25.8 mag (SNR=5, based on the HST ETC). For each visit we will perform two 600s exposures, with a 2.5 pixel dither to reject cosmic rays. For each target we estimate a 2.6 min. overhead for the first exposure, 2.1 min for the second, and 6 min acquisition; a total of ~ 30 min spent on each of these targets. For SLSNe-I at $z > 0.15$, to keep sampling the same rest wavelength range for all SNe, we will use the F336W filter. We will also increase our exposure time slightly, to two 800s exposures, also with a 2.5 pixel dither between. For these SNe observed in F336W we expect to reach ~ 26.6 mag (SNR=5). Our exposure times are motivated by our ability to find CSM interaction events of a similar magnitude to that found in SN 2015cp, to $z < 0.1$ for SE SNe, and one magnitude brighter events to $z < 0.3$ for SLSNe-I.
