## **ABSTRACT**

We propose a public UV survey of Type Ia supernova (SN Ia) host galaxies to provide environmental insights into their progenitor systems. Understanding the progenitors of SNe Ia is vital to reduce systematic uncertainties in their standardization to measure extragalactic distances and to constrain cosmological parameters. Despite surges in SN Ia discoveries, direct progenitor constraints are elusive, and so environment and host galaxy studies, through analysis of the coeval stellar populations, offer valuable alternate routes to perform large-scale population studies. UV coverage is uniquely afforded by HST and a key window into star formation and massive stellar populations. Crucially, the targets have been selected by having pre-existing integral-field spectroscopic (IFS) observations. Galaxy studies have undergone a resurgence with the advent of new IFS instruments, allowing spatially-resolved spectroscopic studies across entire galaxies, but suffer from a lack of wavelength coverage. The UV data proposed is essential to derive meaningful properties of young stellar populations. This will provide the age resolution in stellar population fitting to, for the first time, directly measure the delay-time-distribution of SNe Ia and assess the turn-on timescale at which the youngest SN Ia progenitors explode. Such a data set will have legacy for a multitude of galaxy studies and we are committed to making our joint UV+IFS dataset and analysis public.

## **OBSERVING DESCRIPTION**

WFC3/UVIS SNAPSHOT survey of host galaxies of supernovae - standard imaging proposal. 3 image dither used, sub-aperture used with longer exposures when galaxy able to fit in 2kx2k sub aperture. All exposures to be preflashed to higher recommendation of 20e-/pix to combat CTE effects and preserve signal. Single orbit visits of ~40mins exposing.

For reduced gyro operations: Many targets have no constraint on orientation, and none have time-sensitive scheduling constraints. Of those with orient constraints specified, the vast majority of those are in place in order to enhance the science return (e.g. capturing the full extent of a galaxy, or a neighbouring galaxy) - the core science is unaffected for most if orient constraints cannot be honoured. Given a slower slewing speed, the visit durations could be reduced by 10-20% if this meant a higher fraction of targets are likely to be observed, or it aids in filling in the schedule.
