### **ABSTRACT**

This program acquires various WFC3/IR darks to support the removal and study of dark current, which is crucial to WFC3's success. Similar to previous IR dark monitor programs, about a quarter of the orbits are used to periodically obtain SPARS200/full-frame dark observations. These long observations are used to monitor trends in the bad pixels (e.g., hot, unstable, dead), zeroth read level, and dark current. The remaining orbits collect dark ramps for generating stacked IR dark calibration files for use by the MAST pipeline. The ramps will be collected for each observing mode at a cadence roughly scaled with the newness of the observing mode as well as its popularity in approved recent proposals.

## **OBSERVING DESCRIPTION**

Full-frame and subarray dark calibration images will be collected using the observing configurations listed below. The total number of images collected during the cycle for a given mode is based on 1) the total number of input ramps used in the current superdark for that mode and 2) the popularity of that mode in external science observations.

The IR dark current has remained nearly unchanged since launch (Sunnquist et al., WFC3 ISR 2017-04), which allows for more relaxed scheduling constraints compared to other WFC3/IR dark monitor programs. With the exception of the SPARS200/Full-Frame hot-pixel monitoring observations (which occur once every 2 weeks), all observations have no set scheduling parameters other than that they have to be taken sometime during Cycle 31. The BETWEENs for visits 27-97 were set to preserve continuity from Cycle 30's program 17011.

----- Calibration Justification -----

These new darks collected in Cycle 31 will be used to update the IR dark reference files for use in the WFC3 calibration pipeline. The SPARS200 darks taken twice every month provide a monitor of the bad pixels (e.g., hot, unstable, dead), zeroth read level, and dark current patterns. If necessary, any changes in these areas will be incorporated into the bad pixel and/or super zero calibration reference files.

----- Additional Comments -----

These visits exceed the recommended duration for an internal orbit and generate "MAXIMUM DURATION EXCEEDED" warnings due to an 1800-second non-interruptible hold preceding the dark sequences. However, this hold is necessary to help protect the dark observations from persistence effects from earlier IR observations. The internal orbit warning limit does not apply here. The durations for 17357 are 4986 seconds.
