135 Total Orbits Used

ABSTRACT

The goal for this program is to monitor the degradation of the Charge Transfer Efficiency (CTE) and the efficacy of using post-flash mode over time. These are monitored using a series of WFC3/UVIS darks with NO post-flash taken before and after the monthly UVIS anneal. There is another program that collects post-flashed darks to monitor the hot/warm pixel growth and median dark current of the detector, and so this is a supplementary program to that one, to compare un-flashed internals to these post-flashed ones. When used in conjunction with the post-flashed internals, the un-flashed internals allow for an assessment of how well the post-flash is mitigating the CTE losses.

The products generated from this program include on-going analysis of the post-flash efficacy and an updated report on the CTE degradation over time. This is usually in the form of an ISR.

Prior result is WFC3 ISR 2019-10:

Post-flashed superdarks contain at least 50% more hot pixels, and had 2 e-/hr lower dark current for each anneal cycle.

OBSERVING DESCRIPTION

Ten full-frame four-amp un-flashed 900 sec darks are taken every month. To facilitate scheduling, visits contain 1 dark only (~1400 sec total time, including readout and buffer dump). The darks are grouped around the anneal iterations: 5 darks the week before and 5 darks the week after each procedure.

130 orbits = 13 anneals * 10 orbits per anneal (5 orbits pre-anneal, 5 orbits post-anneal)
