ABSTRACT

We monitor the WFC3 UVIS shutter performance. The exposures in F555W need to be identical to previous cycles. Images with exposure times ranging from 0.5 to 17 seconds will be used to compare the photometric behavior of each shutter blade, for short vs long exposures and check for shutter shading effects. The first exposure of 0.5sec cannot be used since the lamp would be still heating during this exposure, so we will take a set of three 0.5sec exposures. Internal flats in each of the 4 amps will be used to monitor the repeatability and shutter shading effects. We want to include some wavelength dependence, so this proposal now includes exposures in F814W filter, exposure times for which have been estimated using information from WFC3 ISR 2008-21.

OBSERVING DESCRIPTION

Seven Full-frame internal flat field images are collected twice in two different visits, one using F555W and another in F814W using the default tungsten lamp with exposure times of 0.5, 1.0, and 17.0 seconds in order to monitor the shutter and test wavelength dependence. Pairs of flat field images are collected for each exposure time; one using shutter A and another using shutter B. An additional 0.5 exposure is used to heat up the tungsten lamp.
