7 Total Orbits Used

ABSTRACT

This program monitors the sensitivity of three NUV gratings to detect any changes due to contamination or other causes. Observations execute twice a year (in approximately March and September). Beginning in Cycle 24, additional cenwaves were added for the medium-resolution gratings (G185M/2010, G285M/2850, G225M/2306, and G225M/2410). Beginning in Cycle 26, monitoring of G285M was discontinued due to its low

sensitivity and lack of usage over the past few HST cycles. Observations with the G285M grating are Available but Unsupported; users interested in medium-resolution spectroscopic coverage between 2500 and 3200 A are encouraged to use STIS instead. Beginning in Cycle 32, the intermediate cenwave G225M/2306 was exchanged with G225M/2233 to increase wavelength coverage and support the Cycle 31 wavelength-dependent NUV TDSTAB.

OBSERVING DESCRIPTION

As part of the standard monitoring sequence the standard stars, WD1057+719 and G191-B2B, will be observed two times a year (in approximately March and September) in order to measure the time-dependent sensitivity. The first two gratings have stable behavior, while the last is experiencing a steady sensitivity decline.

Each sequence consists of 2 orbits: a 1-orbit visit (target WD1057+719) that covers
G230L/2635,
G230L/2950,

and a 1-orbit visit (target G191-B2B)
G185M/2010,
G185M/1921,
G185M/1786,
G225M/2410,
G225M/2233,
G225M/2186

for a total of 4 orbits.

These comprise the shortest, longest, and an intermediate central wavelengths of the medium resolution gratings and the first two shortest of the low resolution grating.

In Cycle 24 and 25, the four orbits increased to six orbits to include the intermediate cenwaves of all medium resolution gratings including G285M.

In Cycle 26, G285M was removed due to rapid sensitivity decline and reduced orbits back to four.

In Cycles 29 and 31, the exposure and buffer times were updated for the G225M exposures due to the nontrivial TDS of that gratings. No updates were needed for the G230L or G185M exposures.

In Cycle 32, the intermediate G225M/2306 cenwave was replaced with G225M/2233 to increase wavelength coverage and support the wavelength-dependent NUV TDSTAB.

SNR requirements:
-The general requirement is for an SNR of 30 per resel.
-The aim is to obtain TDS calibrations better than 5%.

ETC calculations:
-The ETC calculations use CALSPEC standard model versions wd1057_719_mod_009.fits and g191b2b_mod_012.fits against which the TDS model slopes are referenced.
-The ETC calculations are specified by requiring SNR of 30 at specific wavelengths centered in B-stripe of the NUV detector.

Time constraints:
- Complete monitoring sequence should occur every 6 months.

Proposal 17936 - Visit L1 - Cycle 33 COS NUV Spectroscopic Sensitivity Monitor

Visit
