

18061 - Hubble Census of Nearby Satellites

Cycle: 33, Proposal Category: GO

(Treasury)

(Availability Mode: SUPPORTED)

INVESTIGATORS

<i>Name</i>	<i>Institution</i>
Dr. Michael Gordon Jones (PI) (Contact)	California Institute of Technology
Prof. David J. Sand (CoI) (Contact)	University of Arizona
Dr. Ananthan Karunakaran (CoI) (CSA Member)	University of Toronto
Dr. Paul Bennet (CoI)	Space Telescope Science Institute
Dr. Denija Crnojevic (CoI)	University of Tampa
Dr. Kristine Spekkens (CoI) (CSA Member)	Queen's University
Dr. Burcin Mutlu-Pakdil (CoI) (Contact)	Dartmouth College
Dr. Catherine Fielder (CoI)	University of Arizona
Prof. Dennis Zaritsky (CoI)	University of Arizona
Dr. Amandine Doliva-Dolinsky (CoI) (ESA Member)	University of Surrey
Dr. Laura Congreve Hunter (CoI)	Dartmouth College
Donghyeon Khim (CoI)	University of Arizona
Dr. Deepthi S. Prabhu (CoI)	University of Arizona
Dr. Eric W. Peng (CoI)	NOIRLab - (AZ)

VISITS

<i>Visit</i>	<i>Targets used in Visit</i>	<i>Configurations used in Visit</i>	<i>Orbits Used</i>	<i>Last Orbit Planner Run</i>	<i>OP Current with Visit?</i>
01	(1) DW0132P1422	WFC3/UVIS	1	26-Feb-2026 17:00:27.0	yes
02	(2) DW0133P1543	WFC3/UVIS	1	26-Feb-2026 17:00:27.0	yes

Proposal 18061 (STScI Edit Number: 6, Created: Thursday, February 26, 2026, 5:01:34PM Eastern Standard Time) - Overview

<i>Visit</i>	<i>Targets used in Visit</i>	<i>Configurations used in Visit</i>	<i>Orbits Used</i>	<i>Last Orbit Planner Run</i>	<i>OP Current with Visit?</i>

ABSTRACT

Low-mass galaxies provide a crucial means to test the predictions of cosmological models on small scales where they have frequently struggled to match observations. However, the most detailed comparisons have relied almost exclusively on the satellite galaxies in the Local Group (LG) as this was, until recently, the only system with a high level of completeness at low mass and surface brightness. Here we propose a complete census of ALL satellite galaxies ($M_V < -9$) within MW-like systems out to 10 Mpc. We request 149 orbits to image 149 of these satellites, as well as support to incorporate 111 targets with existing HST observations. Together these observations make up a volume-limited sample of 260 satellites around 22 MW-like hosts. This data set will allow an unbiased characterization of the properties of MW-like satellite systems and end our over-reliance on the LG as the one point of detailed comparison with simulations. Among many other science goals, the observations and analysis that we propose will allow: 1) the most robust measurement of the satellite luminosity function to date, 2) the determination of the globular cluster luminosity function in a lower galaxy mass regime than ever before, and 3) measurements of the star formation histories and quenching times of an unprecedented sample of satellites. Only in the past few years has a project of this scope become possible, as previously the target samples did not exist, and it is only possible with space-based observations. The data products of this program will be fundamental to all studies, both theoretical and observational, of low-mass satellites for the next decade or more.

OBSERVING DESCRIPTION

These are single-orbit WFC3/UVIS observations of 149 nearby ($D < 10$ Mpc) dwarf galaxies in F606W and F814W. The primary goal is to resolve their stellar populations and determine accurate distances from the tip of the red giant branch in the color--magnitude diagrams. For the nearest targets we also aim to model their recent star formation histories based on the visible stellar population.

Each target will have a single, 1-orbit visit with slightly less than half the time for F606W imaging and the remainder for F814W. All of our exposures are short enough that the the ETC recommends some FLASH to help mitigate CTE losses.

In most cases the target will fit on a single UVIS chip and no ORIENT constraints are needed, nor do we need to fill the chip gap (we just adopt a small dither to help reject cosmic rays and shift bad pixels). However, a small number of targets are near bright stars or galaxies and we have specified ORIENT restrictions to minimize contamination and artifacts (e.g. dragon's breath). Wherever possible we attempt to keep bright stars $>30''$ from the chip edges when setting ORIENT constraints. In a few cases POS TARG offsets are needed to help avoid these stars. In addition, about 20 targets are too large for a single chip and in these cases we do dither to fill the chip gap.
