125 Total Orbits Used

ABSTRACT

We propose a snapshot program with WFC3/UVIS (F606W+F814W) to obtain HST imaging of 125 dwarf galaxy candidates. These systems populate the "semi-resolved" regime (i.e., a combination of resolved stars and unresolved light), where distant ($\sim 1 - 3$ Mpc) and faint (i.e., low-mass) dwarf detections are particularly scarce. Identified via an automated search in wide-field data, our candidates constitute an objective, homogeneous dwarf galaxy sample that is not biased to any singular environment. We seek space-based follow-up to resolve their stellar populations, enabling us to (i) derive distances and luminosities, (ii) characterize their structural properties, and (iii) place them in direct comparison with dwarf galaxies within and beyond the Local Group.

Current constraints on low-mass galaxy formation and evolution are primarily derived from the well-studied dwarfs of the Local Group. However, the majority of these systems are satellites of a massive host whose local environment strongly affects their evolution. Drawing conclusions from these nearby quenched satellites from a single environment may result in "over-fitting" cosmological conclusions. It is therefore crucial to study dwarf galaxies not only across mass scales, but also populations of diverse environments. In this proposal, we aim to build the first untargeted, homogeneous census of dwarf galaxies across environments, as an observational benchmark for testing galaxy formation and evolution.

OBSERVING DESCRIPTION

All observations in this snap proposal will be observed in a similar manner using WFC3/UVIS (F606W+F814W).

Observations in each orbit will be 2 exposures of 425 seconds in both F606W and F814W. Exposures will be dithered with the standard 2-point line dither pattern to help remove hot pixels and other artifacts and improve the PSF sampling. The total time per target is 44.9 minutes, which includes: 6.5 minutes for guide star acquisition, exposure overheads (2 x 2.6 min for the first exposure and 2 x 2.1 min for the second in each filter), 850 s exposures per filter, and 2 x 20 s for dithers. We also add a 10 electron/pixel FLASH for the F814W filter since the estimate for exposure at 425s appears to be too low (9.5 electrons/pixel) than the recommended threshold of 20 electrons/pixel.

There are no orientation restrictions.

Proposal 18410 - Visit 01 - Probing the Semi-Resolved Regime: A Homogenous Census of Dwarf Galaxies Across Environments
