ABSTRACT
This program comprises basic tests for measuring the read noise and dark current of the ACS WFC and for tracking the growth of hot pixels. The recorded frames are used to create bias and dark reference images for science data reduction and calibration. This program will be executed four days per week (Mon, Wed, Fri, Sun) for the duration of Cycle 17. To facilitate scheduling, this program is split into three proposals. This proposal covers 320 orbits (20 weeks) from 1 February 2010 to 20 June 2010.

OBSERVING DESCRIPTION
A series of WFC bias and dark frames are recorded on Monday, Wednesday, Friday, and Sunday of every week. On each day prior to SMS 09285 (12 October 2009), four bias frames and four ~1000 sec dark frames are obtained over four orbits using the dual-slope integrator mode of the CEB-R and the default gain setting of 2.0 e-/DN. (No other gain settings are included due to lack of GO demand in Cycle 17.) During SMS 09285 and SMS 09292, Sundays will be dedicated to obtaining subarray biases with the WFC1-1K and WFC1-2K apertures, one full-frame bias with the WFC aperture, and one ~1000 sec dark frame with the WFC aperture. During and after SMS 09299, Sundays will be dedicated to obtaining subarray biases with the WFC1-1K, WFC1-2K, WFC1-IRAMPQ, and WFC2-ORAMPQ apertures. This program uses only internal targets and thus should be scheduled during Earth occultations. Contiguous frame acquisition is not required.

The dark exposures are explicitly set to 1040 sec (1090 sec before SMS 09285) to maximize the use of each 1800-sec internal visit.

No compression is applied to the bias or dark frames.
CALIBRATION JUSTIFICATION
All GO/GTO programs involving the ACS WFC will use the "superbias" and "superdark" reference images created from the frames produced by this program. Science programs involving transient phenomena (e.g., supernovae, variable stars, microlensing, etc.) will rely on the daily accounting of hot pixels derived from this program.

ADDITIONAL COMMENTS
Avoid execution during SAA passages because the enhanced cosmic-ray flux compromises the discrimination of hot pixels from multiple cosmic-ray impacts and contaminates the bias frames with unwanted cosmic rays during readout. Note that SAA-impacted orbits are usable.
