ABSTRACT

The Cosmic Assembly Near-IR Deep Extragalactic Legacy Survey (CANDELS) is designed to document the first third of galactic evolution from $z = 8$ to $z = 1.5$ via deep imaging of more than 250,000 galaxies with WFC3/IR and ACS. It will also find the first Type Ia SNe beyond $z > 1.5$ and establish their accuracy as standard candles for cosmology. Five premier multi-wavelength sky regions selected from the Spitzer Extragalactic Deep Survey (SEDS) provide complementary IRAC imaging data down to 26.5 AB mag, a unique resource for stellar masses at all redshifts. The use of widely separated fields mitigates cosmic variance and yields statistically robust and complete samples of

galaxies down to 10^9 solar masses out to $z \sim 8$.

The program merges two originally separate MCT proposals. The Faber program incorporates a “Wide” imaging survey in three separate fields to ~ 2 orbit depth over ~ 0.2 sq. degrees, plus a “Deep” imaging survey to ~ 12 orbit depth in the two GOODS regions over ~ 0.04 sq. degrees. When combined with ultra-deep imaging from the Hubble Ultradeep Field program (GO 11563), the result is a three-tiered strategy that efficiently samples both bright/rare and faint/common extragalactic objects. The Ferguson program adds an extensive high-redshift Type Ia SNe search, plus ultraviolet “daytime” UVIS exposures in GOODS-N to exploit the CVZ opportunity in that field.

This program, GO 12060, is part of the GOODS-S Deep survey. Special Deep science highlights include:

- * Detection and counts of early galaxies to $z \sim 7-8$ as revealed by red-sensitive WFC3-IR images beyond the Ly α break
 - Measurement of the luminosity function of infant galaxies down to 10^9 solar masses out to $z = 7-8$
 - Measurement of the faint-end LF slope to assess the contribution of faint galaxies to cosmic reionization
- * The physics of early star formation
 - Properties of the earliest star-forming regions -- sizes, star-formation rates, stellar masses and radiation densities, dust contents
 - In concert with Spitzer/IRAC data, measurement of the key relation between star-formation rate and stellar mass -- what set the rate of early star formation in galaxies?

Proposal 12061 (STScI Edit Number: 2, Created: Wednesday, March 21, 2012 8:25:19 PM EST) - Overview

- When did star-formation begin to slow down? In what types of objects? Why?
- * Structural properties, stellar masses, and environments of the earliest identifiable non-QSO AGN as revealed by WFC3-IR
- * Structure of highly reddened, dust-obscured galaxies
- * Deep imaging of the outer envelopes of galaxies
 - Evidence for galaxy-galaxy interactions; counts of merging galaxies
 - Growth of the outer envelopes and evolution of structure of spheroidal galaxies
- * Search for Type Ia SNe to $z \sim 2$ exploiting the long-wavelength J and H sensitivity of WFC3-IR. The first comprehensive search for Type Ia's at these large distances and early epochs.

OBSERVING DESCRIPTION

GOODS-S Overview:

The CANDELS program in Cycle 18 includes:

GO 12060: Deep mosaic in GOODS-S: Y-band + one skirt epoch

GO 12061: Deep mosaic in GOODS-S: J+H, epochs 1-5 + 2 skirt epochs

GO 12062: Deep mosaic in GOODS-S: J+H, epochs 6-10

GO 12063: Wide mosaic in Extended Groth Strip (EGS)

GO 12064: Wide mosaic in UKIDSS/Ultradeep Survey (UDS)

Field maps and details are at <http://candels.ucolick.org>.

Program GO 12061 executes epochs 1-5 of the J+H SNe search observations in GOODS-S, the first four of which are taken before solar avoidance.

Two epochs of skirt observations are also included.

GOODS-S observations are in two flavors: 1) the Deep area proper, which covers approximately 3x5 WFC3-IR tiles and runs east-west near the middle of the GOODS-S region, and 2) the "skirt", which contains 9 tiles in a roughly rectangular pattern running parallel to Deep but offset to the south. The transverse layout of Deep matches the deepest IRAC data in GOODS-S, which are needed for stellar masses. The Deep region and its skirt coordinate with one another and with existing WFC3 and ACS data to achieve the observational goals of the GOODS-S Deep program, as follows:

1) Detect $z \sim 7-8$ galaxies down to $0.5L^*$ by imaging the Deep area to an *effective* depth of 4 orbits in WFC3-IR F125W and F160W and 3 orbits in Y. The reduction to 3 orbits in Y frees up 15 orbits for the skirt area without impacting the SNe search (Y is not prime for SNe) and was tested with extensive sensitivity simulations. The actual number of orbits used for J and H is 5 in order to allow for the inclusion of F350LP exposures in WFC3-UVIS for SNe rejection (see below), hence the term "effective" for the J and H exposure times.

2) Provide at least 32,000 s of exposure time in F814W at each point within the Deep area. This is needed to establish the Ly α break in distant $z \sim 7-8$ galaxies and is essential for discriminating them from reddened foreground galaxies at $z \sim 2$. The quota for F814W is met by adding together ACS parallels from the present program (GO 12060-2) to parallels in existing F814W exposures plus future F814W exposures that are planned in GO 11563. A considerable fraction of the ACS parallel coverage on Deep comes from parallels that originate from the skirt region, which has been placed to the south to balance ERS2 to the north and additionally increases total WFC3-IR coverage in GOODS-S.

3) Maximize the number of J and H orbits usable for SNe searching. SNe are discovered in J and H, but low-redshift interlopers and other SNe types are rejected using short-wavelength ACS exposures taken close in time. These should preferably be taken within 3 days of J/H. The short-wavelength exposure can in principle be provided by 1300 s in contemporaneous F606W ACS parallels, but in practice these are not available over most of GOODS-S, and so a short ~430 s F350LP UVIS exposure is inserted into the J/H orbit instead. The follow-up for discovered SNe is provided in GO 12099.

Meeting the above requirements creates a complex interlocking puzzle in which one must lay out two seamless mosaics to the required depth in both the Deep and skirt areas, locate and orient them to match existing data (e.g., IRAC), have ACS parallels lie on top of the WFC3-IR area as much as possible, reach the desired minimum exposure time of 32,000 s in parallel F814W in the Deep area, use any excess parallel exposure time beyond this productively, take Deep data at multiple epochs spaced ~52 d apart for SNe searching, operate within the narrow range of ORIENTs available at each epoch, allow for at least 30 days of SNe follow-up time after each SNe search epoch, identify suitable guide stars for all observations, break up each orbit into enough exposures to produce a reasonable dither pattern but not waste too much time in extra readouts, and work around solar avoidance, which removes ~50 degrees and two months of calendar time in April-May from the available ORIENTs. The final design was adopted after exploring many possibilities and represents a compromise. It is generally impossible to perturb any aspect of the program significantly without adversely impacting several others.

Details of GOODS-S observations:

* Filters used: Y = F105W, J = F125W, H = F160W, V = F606W, I = F814W,
z = F850LP

* Deep area, J and H exposures:

- 10 1-orbit epochs lasting from Oct 2010 to Feb 2012
- Nominal WFC3-IR exposure times per orbit: 1/2 orbit J, 1/2 orbit H, each broken into two sub-exposures. J and H are co-added for SNe searching; the four exposures yield a good dither pattern
- F350LP inserted for low-z SNe rejection
- Total effective exposure time allowing for F350LP: 4 orbit depth in J, 4 orbit depth in H
- 10 epochs span the solar avoidance gap of ~50 days, permit 8 prime SNe search epochs with 52 d cadence plus one less sensitive search across solar avoidance gap

* Skirt area, J and H exposures:

- Two 1-orbit epochs taken in Jan 2011 and Feb 2011
- Nominal WFC3-IR exposure times per orbit: 1/3 orbit J, 2/3 orbit H, each one broken into two sub-exposures (mimics Wide mosaics in other fields)
- 2 epochs permit one epoch of SNe search on each skirt tile

* Deep and skirt areas, Y:

- 3 orbits in Deep, to complement 4-orbit J+H there
- 1 orbit at another epoch in skirt, to complement 2-orbit J+H there
- All epochs chosen to throw ACS parallels maximally onto Deep

* SNe search combines all J and H exposures from each epoch into a single image. Small-scale four-point dither treats them as part of same exposure, gives sub-pixel sampling

Proposal 12061 (STScI Edit Number: 2, Created: Wednesday, March 21, 2012 8:25:19 PM EST) - Overview

* ACS parallels lying completely or largely within the Deep area:

- Default filter is I-band with goal of obtaining at least 32,000 sec of exposure time at virtually all locations within the Deep area. Sum includes all known past and future I exposures from other programs at that field location. Getting sufficient I takes precedence over getting V in a contemporaneous parallel if total I goal is not met
- Next goal is one orbit (~2500 sec) of z, for variability studies. Again, this takes precedence over V parallel
- If above goals are met, take up to two orbits (5,000 s) of V
- If still more time is left, put into I

* ACS parallels lying largely outside the Deep area:

- First goal is to get one orbit (2500 sec) of I everywhere
- Second goal is to get one orbit (2500 sec) of z for variability studies
- If still more time, put into 2/3 I and 1/3 V to mimic the balance in the Wide mosaics

* Gap from early April to late May due to solar avoidance:

- The gap in 2011 is Apr 7 - May 27 inclusive (50 d)
- 30 d are also budgeted for SNe searching after the last search epoch before solar avoidance (epoch 4)
- GO 12061 covers all four Deep epochs before solar avoidance, plus one after. Both skirt J/H epochs are also included in GO 12061
- GO 12062 covers the last five epochs after solar avoidance. There are no skirt epochs in GO 12062

Specifics of GO 12061:

* J+H in the Deep area:

- The J+H Deep observations cover 5 epochs from Oct 2010 to Jun 2011
- A mosaic is laid out at each epoch to cover the Deep area, with

15-17 WFC3-IR tiles per epoch. Except for displacements and rotations due to occasional missing guide stars, the interior of each mosaic is seamless, but the angles and edges are irregular owing to the varying tile ORIENTS

- Each mosaic is completed within a single visit
- The visits are separated by 52 +/- 3 days on average. The allowable time window for each visit is given by the indicated BETWEEN
- The chosen mosaic overlap is 4%, which yields a minimum overlap of 1% (1.3") in the short direction to defend against estimated pointing errors of ~0.2-0.25"
- Owing to the ~6 arcmin separation between the WFC3-IR and ACS, the ACS parallels from the J+H deep exposures tend to make a circular halo around the Deep region, with a ~50 deg gap towards the northeast due to solar avoidance
- Exposures:
 - Filters used: J = F125W, H = F160W, V = F606W, I = F814W, z = F850LP, plus F350LP
 - Nominal WFC3-IR exposure times per orbit: 1/2 orbit J, 1/2 orbit H (plus 434 sec of F350LP for SNe screening)
 - Each J and H is broken into two sub-exposures
 - Matching ACS parallel exposure times: these are all orbit-long exposures of V, I, or z and are hand-tuned for each tile to meet the desired summed ACS parallel goals above, taking all other data as well as the exposures from this program into account. They are broken into subexposures to match the WFC3 exposures
- Due to the overlapping ACS FOV, the *effective* exposure time of each ACS parallel epoch is roughly twice the nominal exposure,

except for the effect of individual tiles that have been changed to other filters

- Individual exposure times are adjusted to fit orbit visibility periods, allow for buffer dumps, and the need to use F350LP for SNe rejection
- ? dither pattern
- Supernovae timing and schedule requirements:
 - To achieve the desired ORIENTS and SNe cadence, the observations must be taken within the indicated BETWEENs.
 - To avoid shorter than nominal lags in some regions, it is further necessary to observe the Deep area in the same direction at all epochs, either east-west or west-east.
 - Because the short-wavelength SNe screening is provided by F350LP on the same orbit as J+H, there is no requirement to take overlying ACS parallels within 3 days of the matching WFC3-IR tile.
- TO AID SCHEDULING, FURTHER INSTRUCTIONS AND A LIST OF WFC3-IR TILES ORDERED BY RA HAS BEEN GIVEN TO TRICIA ROYLE. PLEASE GET A COPY OF THESE INSTRUCTIONS.

* J+H in the skirt area (Jan and Feb 2011):

- The skirt mosaic consists of 9 WFC3-IR tiles in a roughly rectangular array running parallel to the Deep region and shifted to the south
- Parallels from the skirt overlie the Deep region as much as possible
- 1-orbit J+H exposures are taken for each skirt tile at the first epoch. These are repeated again 52 +/- 3 days later to find SNe.
- The chosen mosaic overlap is again 4%
- Exposures:
 - Filters used: J = F125W, H = F160W, I = F814W, F350LP
 - Nominal WFC3-IR exposure times per orbit: 2/5 orbit J, 3/5 orbit H (plus 434 sec of F350LP for SNe screening)

- Each J and H is broken into two sub-exposures
- Matching ACS parallel exposure times: all skirt parallels are full-orbit I exposures only. They are broken into subexposures to match the WFC3 exposures
- Dither pattern?
- SNe timing and schedule requirements:
 - The exposures must be taken during the designated BETWEENs in order to place the parallels onto the Deep region and to space the skirt epochs 52 +/- 3 days apart
 - The most uniform spacing is achieved if the skirt is observed in the same direction (east to west or west to east) at both epochs
 - Because the short-wavelength SNe screening is provided by F350LP on the same orbit as J+H, there is no requirement to take overlying ACS parallels within 3 days of the matching WFC3-IR tile
 - TO AID SCHEDULING, FURTHER INSTRUCTIONS AND A LIST OF WFC3-IR TILES ORDERED BY RA HAS BEEN GIVEN TO TRICIA ROYLE. PLEASE GET A COPY OF THESE INSTRUCTIONS.

ADDITIONAL COMMENTS

Order and pace of observing the Deep and skirt areas:

- * To maintain the required epoch difference of 52 +/- 3 days at all points in both arrays, the Deep and skirt areas should always be observed in the same direction, either east-west or west-east. To aid in scheduling, we have drawn up a list of WFC3-IR tiles at each epoch ordered by RA, together with other instructions. Tricia Royle has a copy of these instructions. PLEASE GET A COPY.

Guide stars:

- * Guide stars have been pre-screened. Any use of "SINGLES" is

approved by the PI.

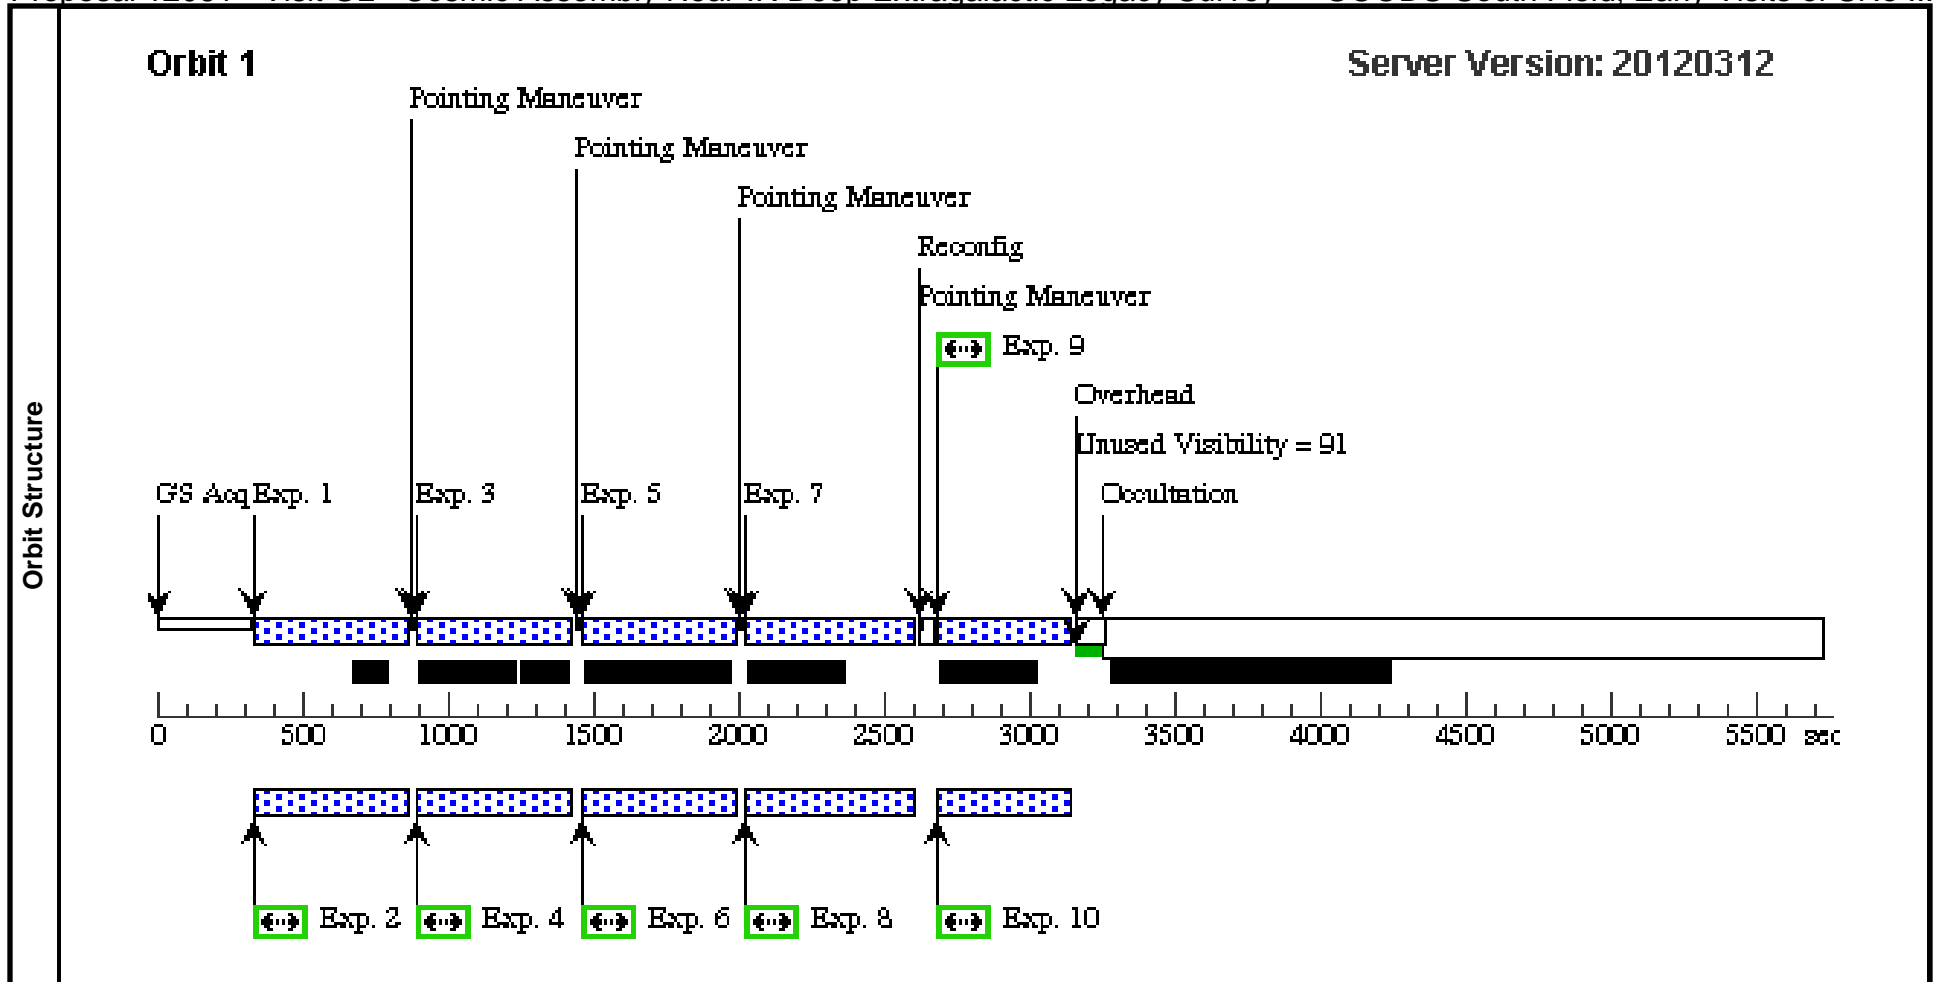

Bright objects -- persistence:

- * All J+H-band exposures will be used for finding SNe. Persistence effects from bright objects in previous exposures create false SNe. Please do not schedule bright objects (like star clusters) in the 8?-orbit window before our observations
