### ABSTRACT

The behavior of the WFC3 UVIS CCD will be monitored daily with a set of full-frame, four-amp bias and dark frames. The internals from this proposal, along with those from the anneal procedure (12343), will be used to generate the necessary superbias and superdark reference files for the calibration pipeline (CDBS).

### OBSERVING DESCRIPTION

This program consists of two parts:

1. Full-frame, four-amp readout bias and dark frames are acquired daily in SAA-free passages throughout Cycle 18 to assess and monitor bad (warm, hot, dead) pixels, and readnoise. Clean frames will be produced with calwf3 and combined into superbias and superdark for delivery to the CDBS as described in WFC3 TIR 2008-01 (Martel et al.). Readnoise will be measured from the overscan regions of individual bias frames as well as from science pixel areas from the difference images of pairs of biases. The location, growth and evolution of hot pixels will be monitored. The darks will

728 Total Orbits Used
also complement the flat-field bowtie search program 12344.

All frames are in standard readout mode (ABCD, gain=1.5 e-/DN, 1x1). Frames are acquired with the following setup:

Even day (5 images/day):
- Visit 1 (1 orbit): 2 Biases, 1 Dark (900 sec)
- Visit 2 (1 orbit): 2 Darks (900 sec)

Odd day (4 images/day):
- Visit 3 (1 orbit): 2 Darks (900 sec)
- Visit 4 (1 orbit): 2 Darks (900 sec)

The paired biases in Visit 1 are obtained consecutively for accurate measurement of the noise.

3/30/11- changes made as follows:
Swapped in a Line 17 Charge Injection Biases
Visit 8Z, 9H, 9P, 9X, A1

Swapped in 100 sec short darks:
Visit A9, AH, AP, AX, B5

4/29/11- changes made as follows:
Swapped in Line 10 Charge Injection Biases to support a Cycle 18 GO program (approved by Ken Sembach):
Visit BD, BL, BT, C1, C9, CH, CP, CX, D5, DD, DL

6/28/11 - swapped in line17 charge injection biases to support 1-orbit MCT using CI (approved by K.Sembach):
visits DX, E5, ED, EL, ET, F1, F9

CALIBRATION JUSTIFICATION
The bias and dark reference files delivered to the CDBS will serve to correct all on-orbit WFC3 UVIS science frames. The main characteristics of the CCD, such as readnoise and warm/hot pixels will be measured and monitored over periods of days, weeks, and months. Expected accuracies are 0.1 e-/pix for readnoise; any bowtie features in the darks should be detectable at the sub-percent level. Results will be summarized in an Instrument
ADDITIONAL COMMENTS
1. In calibration program 12343, an independent set of bias and darks are acquired immediately before and after the monthly anneal. Data from 12343 take precedence over this proposal - no visits from this proposal should be executed before, during, and after the monthly anneal.
2. All visits must be SAA-free.
3. A version of this proposal was successfully used as part of a scheduling test designed to check for issues incorporating internals into post-SM4 SMSs. While some of the visits are longer than the nominal 1800 sec internal limit, this did not seem to adversely stress the system; thus, the same structure as used during the test has been employed here. If the actual scheduling of these proves to be excessively difficult, the visit structure can be reevaluated (as per discussions with Bill J., George C., and Bill Workman).
