12 Total Orbits Used

**ABSTRACT**

This is a one time only program to survey the COS FUV detectors to determine the best locations for science operations. We use the deuterium lamp for two reasons: 1) it only requires internal orbits, and; 2) it is bright and fills the aperture, requiring fewer cross-dispersion locations than an external

target. Because the SED of the lamp is strongly peaked between 1300 and 1600 Å, we use the G130M for the FUVB, and the G160M for the FUVB.

## **OBSERVING DESCRIPTION**

This program examines the two COS FUV detectors in order to find the best lifetime locations for the first change in lifetime position and all subsequent moves. The objective is to determine which regions of the detector are least affected by dead spots and fixed pattern noise. We intend to determine this by exposing the active area which can be used for science (and accessed by the deuterium lamp) to the deuterium lamp through the FCA. This requires moving the FCA in Y to locations that will expose as much of the detectors as possible. Because the energy distribution of the deuterium lamp is strongly peaked at intermediate wavelengths, to uniformly illuminate an entire detector segment it is necessary to use the G130M for the FUVB and the G160M for the FUVB.

### Exposure Times:

Our analysis plan is to use the FPPOS algorithm to extract 1-D flats and lamp spectra at several Y locations, so we must use all 4 FPPOS settings at each off-set location. For the FPPOS algorithm to produce useful results, a S/N of about 10 is required at each FPPOS for a strip 10 pixels tall in Y, which corresponds to the narrowest cross dispersion profile of the medium resolution gratings (the G160M). Thus, the requirement of a S/N of 10 in a 10 pixel high Y strip determines our exposure times. These were determined by scaling previous deuterium lamp exposures obtained during SMOV (programs 1143 and 11488). The expected count rates were assumed to be 15% less due to the time dependence of the sensitivity since SMOV. The SMOV data have minimum count rates of about 0.015/pixel, or 0.15 over a 10 pixel slit. To obtain a S/N = 10 requires an exposure time of  $100/0.15 = 666$  sec, and allowing for a 15% reduction in count rate is 784 s. The individual exposures are set to 900 s which should be adequate, including an additional 15% fading of the lamp due to use throughout the program.

### Positioning the spectra:

When XAPER = 0, the PSA and FCA spectra are centered at about Y = 540 for the FUVB. Since 21 XAPER steps is 1" and 1 FUVB Y pixel is 0.1", the Y location of the spectrum is related to XAPER as follows:

$$\text{XAPER} = -2.1 * (\text{Y} - 540)$$

The range of XAPER is set by soft stops at +/-275 in LAPXSTP, which is related to XAPER as follows:

$$\text{LAPXSTP} = \text{XAPER} + 126.1 \text{ for the PSA and}$$

LAPXSTP = XAPER -153.1 for the FCA

Prog. 12096 showed that values of  $LAPXSTP < 0$  for the PSA allowed light from the wavecal onto the detector. So the useful region of the PSA (for normal operations) is defined by  $0 < LAPXSTP < 275$ , which corresponds to  $126 < XAPER < 401$ , or  $469 < Y < 600$ .

For the FCA,  $-275 < LAPXSTP < 275$ , corresponds to  $-122 < XAPER < 153$ , or  $336 < Y < 598$ . Because the region below  $Y = 469$  is inaccessible to the PSA and the region above  $Y = 600$  results in light leaks (and is inaccessible to the FCA), we will use the FCA to explore the region  $465 < Y < 595$ . This can be done by covering the range  $-273 < LAPXSTP < 0$  with 6 positions (5 would just work, but 6 insures good Y coverage). The selected positions are:

LAPXSTP = 0.0, -54.6, -109.2, -163.8, -218.4, -273.0

Y = 467, 493, 519, 545, 571, 597

XAPER = 153.1, 98.5, 43.9, -10.7, -65.3, -119.9

offsets = -7.3, -4.7, -2.1, +0.5, +3.1, +5.7 arc sec

Notes on special commands:

S/C Observations using the special command ELAPERSET along with QUESIPARM APERTURE FCA and QUESIPARM DET FUV that preceeds ever XAPER command the sets the value for the aperture location as the default location for the FCA so that the subsequent XAPER command will move from the appropriate location.

Then each subsequent exposure contains a special command instruction ELNOAPMAIN, which keeps the instrument from returning to the default location after each exposure.

Finally, observations 7 - 12 begin with a set of commands that changes the HV setting to the low value.

**CALIBRATION JUSTIFICATION**

We must perform a survey of the FUV detectors to determine their on orbit properties in order to select the best locations to move for new lifetime positions.
