156 Total Orbits Used

ABSTRACT

This program continues the CCD anneal cycle that has taken place every 4 weeks for the last 6 observing cycles. We obtain WFC biases and darks before and after the anneal in the same sequence as done for the ACS daily monitor. The anneal observation supplements the monitor observation sets during the appropriate week.

OBSERVING DESCRIPTION

The pre-anneal bias and dark frames are taken within 12 hours of starting the anneal. The anneal itself is then run for 12 hours. After returning to operational mode, another set of bias and dark frames are taken within the next 12 hours. The whole procedure is repeated every 4 weeks, i.e, 13 times during Cycle 20.

CALIBRATION JUSTIFICATION

Annealing is required to reduce the number of hot pixels on the CCDs. Hot pixels are steadily generated by high energy radiation striking the detectors. Bias and dark images are collected to monitor the efficiency of the anneal and track the time needed for the bias level to equilibrate.

ADDITIONAL COMMENTS

All data is obtained using internal targets only, so all exposures should be taken during Earth occultations. SAA passages should be avoided.
