24 Total Orbits Used

ABSTRACT

This program monitors the population of pixels exhibiting anomalous variations of QE between anneals. During the time between anneals, this population of pixels with lowered sensitivity develops, which for the most part is reset by the next anneal. This effect has shown to be more prominent in the blue than the red. The lowered QE pixel population appears to be a unique set to each cycle, not a fixed subset that turns on and off with each anneal, and are distributed across the detector randomly.

OBSERVING DESCRIPTION

Over a 6 month period we will take 24 internal orbits using the F438W, F814W, F225W, F336W filters and both Tungsten and Deuterium lamps. Visits 1-6 and 19-24 will consist of 2 orbits before and after the monthly anneal to total 4 visits per month. Visits 7-18 will be spread across each month between the anneals of Dec/Jan 31-6 and Mar 25-31. At the beginning of each orbit a subarray will be taken to warm up the lamp.

All exposure times have been chosen to achieve a mean level of ~37,000 counts per pixel. All orbits are non-interrupt in order to minimize cycling of the limited-lifetime lamp.

CALIBRATION JUSTIFICATION

These observations will enable us to track down when the population of anomalous pixels develops within a cycle.

Proposal 13169 - Visible before Dec 3-9 anneal (01) - CCD Anomalous QE Pixels

Thu Mar 14 01:33:41 GMT 2013

Visit	Proposal 13169, Visible before Dec 3-9 anneal (01), completed Diagnostic Status: Warning Scientific Instruments: WFC3/UVIS Special Requirements: BETWEEN 01-DEC-2012:00:00:00 AND 03-DEC-2012:00:00:00 <i>Comments: This visit needs to be scheduled immediately prior to the UVIS anneal for the week of Dec 3-9 2012</i>
