156 Total Orbits Used

ABSTRACT

This program continues the CCD anneal cycle that has taken place every 4 weeks for the last 7 observing cycles. We obtain WFC biases and darks before and after the anneal in the same sequence as done for the ACS daily monitor. The anneal observation supplements the monitor observation sets during the appropriate week.

OBSERVING DESCRIPTION

The pre-anneal bias and dark frames are taken within 12 hours of starting the anneal. The anneal itself is then run for 12 hours. After returning to operational mode, another set of bias and dark frames are taken within the next 12 hours. The whole procedure is repeated every 4 weeks, i.e, 13 times during Cycle 21.

CALIBRATION JUSTIFICATION

Annealing is required to reduce the number of hot pixels on the CCDs. Hot pixels are steadily generated by high energy radiation striking the detectors. Bias and dark images are collected to monitor the efficiency of the anneal and track the time needed for the bias level to equilibrate.

ADDITIONAL COMMENTS

All data is obtained using internal targets only, so all exposures should be taken during Earth occultations. SAA passages should be avoided.

Proposal 13594 - Visit AA - CCD Hot Pixel Annealing

Orbit 1
Unused Visibility = 3229

The diagram shows a horizontal axis representing time in seconds, ranging from 0 to 5500 with major ticks every 500 seconds. A green bar starts at 0 seconds and ends at approximately 3200 seconds. Within this green bar, two smaller black bars are shown: one from 0 to about 250 seconds labeled 'Exp. 1', and another from about 250 to 500 seconds labeled 'Exp. 2'. A white bar starts at approximately 3200 seconds and ends at approximately 5500 seconds, labeled 'Occultation'. There are also two small black bars on the x-axis: one between 500 and 750 seconds, and another between 1500 and 1750 seconds.
