ABSTRACT
This program comprises basic tests for measuring the read noise and dark current of the ACS WFC and for tracking the growth of hot pixels. The recorded frames are used to create bias and dark reference images for science data reduction and calibration. This program will be executed on Monday, Wednesday, Friday, and Saturday of each week. To facilitate scheduling, this program is split into three proposals. This proposal covers 225 orbits (17 weeks, 1 day) from 4 March 2016 to 1 July 2016.

OBSERVING DESCRIPTION
A series of full-frame WFC bias and dark frames are recorded on Monday, Wednesday, and Friday of every week. On each day, two standard bias frames, two "post-flashed bias" frames (or, more accurately, 0.5 s dark frames), and four 1000.5 sec post-flashed dark frames are obtained over four orbits using the default gain setting of 2.0 e-/DN. (No other gain settings are fully supported by STScI during Cycle 23.) A series of 13 standard WFC1-1K subarray bias frames are recorded on Saturdays. This program uses only internal targets and thus should be scheduled during Earth occultations. Contiguous frame acquisition is not required.

No compression is applied to the bias or dark frames.

-------- Realtime Justification --------

----- Calibration Justification ----- 

All GO/GTO programs involving the ACS CCDs will use the "superbias" and superdark" reference images created from the frames produced by this program. Science programs involving transient phenomena (e.g., supernovae, variable stars, microlensing, etc.) will rely on the daily accounting of hot pixels derived from this program.

-------- Additional Comments --------

Avoid execution during SAA passages because the enhanced cosmic-ray flux compromises the discrimination of hot pixels from multiple cosmic-ray impacts and contaminates the bias frames with unwanted cosmic rays during readout. Note that SAA-impacted orbits are usable.
