208 Total Orbits Used

## ABSTRACT

This program comprises basic tests for measuring the read noise and dark current of the ACS WFC and for tracking the growth of hot pixels. The recorded frames are used to create bias and dark reference images for science data reduction and calibration. This program will be executed on Monday, Wednesday, and Friday of each week. To facilitate scheduling, this program is split into three proposals. This proposal covers 208 internal orbits (4 orbits/day x 52 days) from 2 July 2018 to 29 October 2018.

## OBSERVING DESCRIPTION

A series of full-frame WFC bias and dark frames are recorded on Monday, Wednesday, and Friday of every week. On each day, two standard bias frames, two "post-flashed bias" frames (i.e., 0.5 s post-flashed dark frames), and four 1000.5 sec post-flashed dark frames are obtained over four orbits using the default gain setting of 2.0 e-/DN. This program uses only internal targets and thus should be scheduled during Earth occultations. Contiguous frame acquisition is not required.

No compression is applied to the bias or dark frames.

----- Realtime Justification -----

----- Calibration Justification -----

All GO/GTO programs involving the ACS CCDs will use the "superbias" and superdark" reference images created from the frames produced by this program. Science programs involving transient phenomena (e.g., supernovae, variable stars, microlensing, etc.) will rely on the daily accounting of hot pixels derived from this program.

----- Additional Comments -----

Avoid execution during SAA passages because the enhanced cosmic-ray flux compromises the discrimination of hot pixels from multiple cosmic-ray impacts and contaminates the bias frames with unwanted cosmic rays during readout. Note that SAA-impacted orbits are usable.

	<div style="display: flex; justify-content: space-between;"> <div> <b>Orbit 1</b>  Unused Orbital Visibility = 3202 </div> <div> <b>Server Version: 20180409</b> </div> </div> <p>The diagram illustrates the orbit structure for Orbit 1. The x-axis represents time in seconds, ranging from 0 to 5500. A green bar indicates the period of observation, starting at 0 seconds and ending at approximately 1400 seconds. Two exposure events, 'Exp. 1' and 'Exp. 2', are marked at the beginning of this period. A black bar is shown below the green bar from approximately 250 to 500 seconds. Another black bar is shown below the green bar from approximately 1600 to 1800 seconds. A vertical arrow labeled 'Occultation' points to the end of the green bar at approximately 3200 seconds. A white bar continues from 3200 seconds to 5500 seconds.</p>

	<div style="display: flex; justify-content: space-between;"> <div> <b>Orbit 1</b>  Exp. 1  Unused Orbital Visibility = 3202  Exp. 2  Occultation </div> <div> <b>Server Version: 20180409</b> </div> </div> <p>The diagram illustrates the orbit structure for Orbit 1. The x-axis represents time in seconds, ranging from 0 to 5500. A green bar indicates the observation period, starting at 0 seconds and ending at approximately 1400 seconds. A black bar indicates the occultation period, starting at approximately 1400 seconds and ending at approximately 3200 seconds. Arrows point to the start of the green bar (labeled Exp. 1), the start of the black bar (labeled Exp. 2), and the end of the black bar (labeled Occultation). The text 'Unused Orbital Visibility = 3202' is displayed above the green bar. The server version '20180409' is displayed in the top right corner.</p>
