### **ABSTRACT**

The standard astrometric catalog in the field of globular cluster Omega Cen has been used to examine the geometric distortion of WFC3 UVIS and IR as function of wavelength in multicycles calibration programs over last 7 years of WFC on HST board. All observations from these programs have been reduced and provided the multi-wavelength geometric distortion in UVIS and IR detector. The derived geometric distortion coefficients implemented in IDCTAB format are used in HST pipe-line to correct for ~7% distortion in WFC3 images down to 1%.

Additional to multi-wavelength WFC3 geometric distortion, all observations of Omega Cen taken through F606W and F160W UVIS and IR filters respectively during the last 9 years (all together 20 epochs) were used to look for time dependency of UVIS and IR geometric distortion and the effect of the scale change due to the thermal breathing. The results of the stability WFC3 geometric distortion published in WFC3-ISR-02-15 (Kozhurina-Platais & Anderson) have show that the UVIS geometric distortion is stable over 9 years on-orbit within 0.05 pixels or 2 and 6 mas in UVIS. The results of WFC3/IR published in WFC3-ISR-03-12 (Kozhurina-Platais et al) have show that the IR geometric distortion is stable over 2 years on orbits within 0.1 pixel or 6 mas.

The purpose of this calibration proposal is to continue the monitor of the WFC3 geometric distortion stability of over time.

The observations of Omega Cen through UVIS F606W filter and F160W IR filter will be used to derive the skew and scale terms of the geometric distortion and look for any secular changes.

### **OBSERVING DESCRIPTION**

## Proposal 15000 (STScI Edit Number: 3, Created: Thursday, February 8, 2018 6:03:37 PM EST) - Overview

The observation of Omega Cen through F606W and F160W as a standard filters in UVIS and IR will be observed with the same pointing but with different roll-angle of the OTA in around December 2017, March/April 2018 and June/August 2018.

The set of 6 exposures in F606W and F160W filters are sampled in the allowed full range of roll-angles at the ecliptic latitude of Omega Cen, and ranged approximately from 270 to 280 degree in December 2017- January 2018. Three UVIS exposures in 1 orbit will be observed in the following sequence of off-nominal (~260 degree) roll-angles: Orbit #1 -  $-/+15, 0, +/-5$  degree. Three IR exposures in 1 orbit will be observed in the following sequence of off-nominal (~250 degree) roll-angles: Orbit #2 -  $-15/+15, 0, +/-5$  degree. The set of 6 exposures in F606W and F160W filters are the allowed full range of roll-angles at the ecliptic latitude of Omega Cen, and ranged approximately from 290 to 5 degree in around March/April 2018. Three UVIS exposures in 1 orbit will be observed in the following sequence of off-nominal (~320 degree) roll-angles: Orbit #3  $-/+15, 0, +/-5$  degree. Three IR exposures in 1 orbit will be observed in the following sequence of off-nominal (~320 degree) roll-angles: Orbit #4  $-15/+15, 0, +/-5$  degree. The set of 6 exposures in F606W and F160W filters are the allowed full range of roll-angles at the ecliptic latitude of Omega Cen, and ranged approximately from 50 to 100 degree in around June/July 2018. Three UVIS exposures in 1 orbit will be observed in the following sequence of off-nominal (~100 degree) roll-angles: Orbit #5  $-/+15, 0, +/-5$  degree. Three IR exposures in 1 orbit will be observed in the following sequence of off-nominal (~100 degree) roll-angles: Orbit #6  $-15/+15, 0, +/-5$  degree.

In order to improve the schedule, a small range of roll is allowed at each specific roll angle. The order of the exposures in each orbit is specified by a SEQUENTIAL Special Requirement and the order of the orbits is specified by AFTER Special Requirements. To maintain accurate pointing control, 2-guide star acquisitions are used. If suitable guide stars can be found, the same pair of guide stars are used for 18 exposures.

The geometric distortion of WFC3 in 13 UVIS and 8 IR filters were calibrated using the standard astrometric catalog of Omega Cen (Anderson & van der Martel, 2010). The goal of this proposal is to monitor the geometric distortion of UVIS and IR detector. The skew parameter (the non-perpendicularity of coordinate axes), which is the major parameter in the geometric distortion model, in the ACS/WFC case, is changing with time in the level of 40 mas over 15 years on board of HST.

As it have show by Kozhurina-Platais et.al (WFC3-ISR -2015-02), the skew in UVIS geometric distortion model during 7 years of WFC3 on board

## Proposal 15000 (STScI Edit Number: 3, Created: Thursday, February 8, 2018 6:03:37 PM EST) - Overview

is stable and in the range of  $\pm 4$  mas which give the offset at  $\ll \pm 0.1$  pixels at the far edges of UVIS frames. Thus, the goal of this calibration proposal is to continue to monitor the UVIS and IR skew as a function of time.

The 3 exposures in UVIS with steps of roll-angles  $\pm 5$  degree of off-nominal roll-angles required 3 orbits, the same 3 exposures in IR with the steps of roll-angles  $\pm 5$  degree of nominal roll-angles, also required 3 orbits. However, APT requires each Visit to begin at the start of an orbit and therefore calculates that this proposal requires 18 orbits, which APT indicates is mostly unused. Accordingly, APT generates a Warning that the Visits will not fit within the required 2 orbits and 10 Warnings that the SEQUENTIAL sets cannot fit within one orbit. However, based upon known overheads for the moderate roll-slews used and overheads for full guide star acquisitions, these indicated VISITS (1,2,3, with UVIS and 4,5,6 with IR) should be scheduled in 2 orbits. The exposures with UVIS are: Orbit #1, Visits 1,2,3 off-nominal roll  $\pm 15, 0, \pm 5$  degree; Orbit #2, Visits 7,8,9 off-nominal roll  $\pm 15, -15, 0, \pm 5$  degree; Orbit #3, Visits 13,14,15 off-nominal roll  $\pm 15, -15, 0, \pm 5$  degree. The exposures with IR are: Orbit #1, Visits 3,4,5 off-nominal roll  $\pm 15, -15, 0, \pm 5$  degree; Orbit #2, Visits 10,11,12 off-nominal roll  $\pm 15, -15, 0, \pm 5$  degree; and Orbit #3, Visits 16,17,18 off-nominal roll  $\pm 15, -15, 0, \pm 5$  degree.

Proposal 15000 - Visit 01 F606W (01) - WFC3 Astrometric Scale Monitoring
