ABSTRACT

This is a continuation of programs 11433 (SMOV), 11915 (Cy 17), 12338 (Cy 18), 12712 (Cy 19), 13098 (Cy 20), 13587 (Cy 21), 14029 (Cy 22), 14391 (Cy23), 14548 (Cy24), 14998 (Cy25), 15591 (Cy26), 15731 (Cy27), and 16411 (Cy28). We study the stability and structure of the IR channel flat field images through all filter elements. Flats are monitored, to capture any temporal trends and delta flats are produced. High signal observations will provide a map of the pixel-to-pixel flat field structure, as well as identify the positions of any dust particles.

This version contains a full set of IR filter exposures once in the middle of the cycle. In addition we will acquire 3 exposures in each of the broadband filters F105W, F110W, F125W, F140W, and F160W twice during the cycle. This work builds on the ISR of Ryan & Baggett (2015-011) and Ryan (2019-06).

----- Calibration Justification -----

The target electrons per pixel is 40,000 - 60,000, so that the Poisson noise of an individual pixel and a single exposure will be 0.5%, comparable to or smaller than any individual astronomical image made by WFC3 IR. With 2 well-exposed flats per medium- and narrow-band filter, the Poisson-limited noise after combining 2 individuals will be ~1.4x smaller. For the broad-band filters, we can combine 3 exposures to produce bi-monthly flats, or combine a total of 18 exposures for a extremely low noise flats in the case temporal variations are limited.

Analysis results will be detailed in an ISR.

OBSERVING DESCRIPTION

In this program, we study the stability and structure of the IRchannel flat field images through all filter elements. Flats will be monitored to capture any trends over time in the flat fields and delta flats produced. High signal observations will provide a map of the pixel-to-pixel flat field structure, as well as identify the position of any dust particles. This version contains a full set of IR filter exposures once in the middle of the cycle. In addition, we will acquire 3 exposures in each of the broadband filters F105W, F110W, F125W, F140W, and F160W twice during the cycle.

Orbit 1
Unused Orbital Visibility = 3142

The diagram shows a timeline for Orbit 1. The x-axis represents time in seconds from 0 to 6000. A green bar indicates the total exposure time, starting at 0 and ending at approximately 3142 seconds. Within this green bar, two smaller bars represent 'Exp. 1' (from 0 to ~1003s) and 'Exp. 2' (from ~1003s to ~1086s). A black bar labeled 'Reconfig' is located between the end of Exp. 2 and the start of the occultation period. The occultation period is a white bar starting at approximately 3142 seconds and ending at approximately 5700 seconds. The remaining time from 5700s to 6000s is labeled as 'Unused Orbital Visibility'.
