ABSTRACT

This program comprises basic tests for measuring the read noise and dark current of the ACS WFC and for tracking the growth of hot pixels. The recorded frames are used to create bias and dark reference images for science data reduction and calibration. This program will be executed on Monday, Wednesday, and Friday of each week. To facilitate scheduling, this program is split into three proposals. This proposal covers 204 internal orbits (4 orbits/day x 51 days) from 4 Mar 2024 to 28 Jun 2024.

OBSERVING DESCRIPTION

A series of full-frame WFC bias and dark frames are recorded on Monday, Wednesday, and Friday of every week. On each day, two standard bias frames, two "post-flashed bias" frames (i.e., 0.5 s post-flashed dark frames), and four 1000.5 sec post-flashed dark frames are obtained over four orbits using the default gain setting of 2.0 e-/DN. This program uses only internal targets and thus should be scheduled during Earth occultations. Contiguous frame acquisition is not required.

No compression is applied to the bias or dark frames.

-------- Realtime Justification --------

-------- Calibration Justification --------

All GO/GTO programs involving the ACS CCDs will use the "superbias" and superdark" reference images created from the frames produced by this program. Science programs involving transient phenomena (e.g., supernovae, variable stars, microlensing, etc.) will rely on the daily accounting of
Avoid execution during SAA passages because the enhanced cosmic-ray flux compromises the discrimination of hot pixels from multiple cosmic-ray impacts and contaminates the bias frames with unwanted cosmic rays during readout. Note that SAA-impacted orbits are usable.
