**ABSTRACT**

This program will obtain a set of dark exposures taken with full frame readout. The data will be used to construct dark current, super bias, and read noise reference files. Master bias observations are only to be taken during the first visit of the program. Dark exposures using NRSIRS2RAPID use exposure durations of approximately 3000 sec (200 groups). This duration is the longest being recommended to users, and it may be changed in the

future. Dark exposures with NRSRAPID are approximately 1000 sec (88 groups) in duration. The observations are split into individual visits - 100 for the NRSIRS2RAPID darks and 50 for the NRSRAPID darks. Two bias frames, one in each of the readout patterns, will also be acquired. These visits are executed in parallel with no constraints on pointing.

This calibration program is provisional and may change in response to system developments and final science program.

## **OBSERVING DESCRIPTION**

This program will obtain a set of full-frame dark exposures for constructing the dark current and “Master Bias” reference files and readnoise determination.

For the masterbiases, we will obtain one NRSRAPID exposure with  $nInt=50$  and  $nGroups=1$  and one NRSIRS2RAPID exposure with  $nInt=50$  and  $nGroups=1$ . A valid Master Bias reference file is critical for correct preprocessing of NIRSpec data, instead of scheduling these in the first month of the cycle, we will use the commissioning superbias and schedule these for the last 6 months of the cycle as an offset dataset.

For the full-frame NRSIRS2RAPID dark reference cube, we will obtain  $\sim 100$  long dark exposures with  $nGroups=200$ . These are split into observation folders of 8-9 exposures, to be scheduled in 12 epochs ( $\sim$  one month long) across Cycle 1. The arrays will be read out in NRSIRS2RAPID mode in order to be useful for both NRSIRS2 and NRSRAPID, and to best identify discrete cosmic ray events. Likewise for the NRSRAPID dark reference cube, we will obtain  $\sim 45$  long dark exposures with  $nGroups=88$ , split into observation folders of 3-4 exposures, to be scheduled in 12 epochs ( $\sim$  one month long) across Cycle 1.

## **TIMING CONSTRAINTS**

Timing constraints assume a launch of 25 Dec 2021 and a start for Cycle 1 on 23 Jun 2022.

This program is 12 epochs of NRSIRS2RAPID readout data and 12 epochs of NRSRAPID readout data.

Each epoch consists of 8-9 visits for NRSIRS2RAPID data and 3-4 visits for NRSRAPID data, that need to be scheduled within 30 days of each other. The cadence should be one epoch per month.

Observations are grouped by readout pattern.

The first epoch for both series should be in the first month of Cycle 1. This timing is critical to establishing a baseline data set as soon as science observations begin.

Epochs are then scheduled every 30 days. Constraints are set relative to the first epoch of Cycle 1 for each target. The 30-day windows for each epoch are meant to give schedulers some flexibility, but the closer to a regular cadence we can achieve, the better for monitoring

In the event of a change in launch date and/or a change in the start of Cycle 1, the BETWEEN time constraints on the first epoch observation will need to be adjusted by that number of days.
