ABSTRACT

The JWST Cycle 1 routine wavefront sensing and control (WFS&C) maintenance calibration program is necessary to fulfill a Level 1 Mission requirement on image quality. These routine WFS&C measurements will execute every ~2 days throughout Cycle 1 (and every cycle thereafter). The nominal plan is that the majority of observations will be sensing measurements only, wavefront control visits will execute only as needed. The wavefront control activities are estimated to be carried out at most once every 2 weeks to ensure optimal JWST image quality performance. The Cycle 1 WFS&C maintenance observations are fashioned following the similar program that will be executed every 2 days during the latter half of JWST commissioning (OTE-26; APT PID 1163).

OBSERVING DESCRIPTION

The Routine Cycle 1 Calibration for WFS&C uses the Fine Phasing (FP) template with observations defined for:

-FP using the NIRCam weak lenses
And
-LOS Jitter using a small subarray in NIRCam.
These are the base observations for monitoring the JWST image quality.

The overall program is set up with the grid of four hundred stars (Kmag=7.0+/-0.1) and 5 copies of each observation. For APT performance reasons, the total of 2000 visits are split across 4 APT programs, which jointly make up the entire Cycle 1 calibration program. The PIDs are 2586, 2724, 2725, 2726.

This PID 2725 has 100 targets with RA from ~12h to 18h. The visits are set up to be able to have a wavefront control file added down-stream of

APT, if it is deemed necessary.

One visit from any of these 4 programs should be scheduled every two days, selecting from any target which is conveniently close to the current observatory pointing at that time. The monitoring cadence has a loose tolerance, notionally 48 hours plus or minus 12 hours between successive visits; this provides flexibility to schedule wavefront monitoring with minimal constraints to the timing of science visits.

We expect only 182 of the total 2000 visits to be executed in 1 year. The remaining >90% will not be executed. This is intentional to provide a grid of WF sensing targets across the entire sky and then only use ones that minimize slew times based on the targets in the science plan. With 400 targets the average spacing between targets is ~10 degrees; from any point on the sky JWST can slew ~5 deg or less to a nearby WFS target.

The operations concept for wavefront monitoring is that we have a continuous stream of WFSC routine monitoring and maintenance visits every two days, drawn from these 4 APT programs. These visits are by design interchangeable and all identical except for choice of target star.
The JWST WF maintenance plan is to correct the mirrors using a wavefront control file as needed, only when needed. This, by design, is expected to be no more often than once every 14 days. Corrections will not be made every 14 days if the mirrors haven't drifted out of alignment; conversely if monitoring visits show significant misalignments on shorter timescales we will not wait the 14 days to issue a control - we'd issue a control in the next WFS visit two days later. The observatory was designed to be stable enough to need corrections no more often than every couple of weeks. Based on current modeling, observatory stability may substantially exceed this requirement and corrections may be much less frequent than the 14 day cadence.

When a correction is needed (based on the analysis of some observation N), it can be attached to the next observation N+1 in the sequence. This is done by the OTE/WFSC team delivering a wavefront control file to PPS, and requires no changes in APT.

Note: For the observations here, using the ROUTINE wavefront sensing special requirement, APT conservatively assumes the overheads for Wavefront control and for subsequent confirmation sensing after the control are included, ~8330s per visit. If a control file is not attached to the visit downstream, the visit will only do the sensing/monitoring measurements, which take ~4340s. Furthermore, APT assumes the default slew time of 1800s per visit, but by construction since the slew distances will always be 5 degrees or smaller, slew times should generally be less than roughly 1000s.
