ABSTRACT

Full frame DARKS for Cycle 4

This program will obtain full frame NIRSpec dark exposures in NRSRAPID and NRSIRS2RAPID readout modes in order to create updated dark and bias reference file, as well as for correcting evolving hot pixels. Six epochs (with overlap) are implemented via "between" special requirements, so that darks can be acquired throughout cycle 4. This is in order to have enough contemporary IRS2 dark data to create new independent reference files every 3- 4 months. Observations can be executed as internal parallels with no constraints on pointing.

Ideally, IRS2 darks should be scheduled when the detector system is expected to be in IRS2 readout mode, and traditional (TRAD) darks should be scheduled when the detector system is expected to be in traditional readout mode, based on nominal execution of the observation plan. This is to minimize detector/ASIC temperature drifts after switching readout mode that can negatively impact dark data. We have cut back on the number of TRAD darks to reflect that there are fewer opportunities to schedule these according to our new mode-switch limitations.

We planned refined "between" periods to spread the darks out a little, but also keep large overlap periods for scheduling flexibility.

This calibration program may change in response to system developments and the final Cycle 4 science program.

OBSERVING DESCRIPTION

OBJECTIVE: Obtain NIRSpec darks in NRSRAPID and NRSIRS2RAPID readout mode (both full frame) of sufficient integration length in order to create / update the SUPERBIAS, DARK, READNOISE, and REFPIX (IRS2 processing) reference files for NIRSpec.

METHOD: Take darks of appropriate integration length using the NIRSpec Dark template, executed as internal parallels. The length of the integrations is currently expected to be 200 groups (NRSIRS2RAPID) and 88 groups (NRSRAPID).

JUSTIFICATION: Cycle 1-3 calibration program confirmed that the dark is changing over time, with the most prominent change being the

JWST Proposal 9273 (Created: Wednesday, April 15, 2026, 12:00:40PM Eastern Standard Time) - Overview

accumulation of additional hot pixels, likely due to cosmic ray induced radiation damage. The rate of increase is approximately 100 new hot pixels per detector per month, therefore regular updates of the dark (and bias) reference files and related bad pixel masks are necessary. Our goal is to generate a new set of IRS2 bias and dark reference files every ~4 months, as this corresponds to a (relative) change in hot pixels of about 10% between updates.

Due to recent improvements in the bias/dark reference file creation tools (better cosmic ray and snowball removal) we can now create dark reference files with sufficient signal-to-noise and good data quality flagging with fewer input files, and therefor request 76 darks for IRS2 readout mode, over the course of cycle 4. Additionally, reflecting the reduced cadence of opportunities to acquire TRAD darks, and the reduced need for them, we are hoping to acquire about 40 TRAD darks over the cycle.

CYCLE 4 CALIBRATION: Continuation of cycle3 calibration program 'NRS Full Frame Darks' (PID 6633), with the modifications mentioned above.

TIMING CONSTRAINTS: We will employ a set of 'between' special requirements to ensure that darks are spread out over the course of cycle 4, to sample the evolving hot pixel population. There are 4 epochs of about 3 months long each. Adjacent observations share 10 days overlap in the special requirement timing range with each other to allow for some scheduling flexibility. IRS2 darks are now scheduled when the detector system is expected to be in IRS2 readout mode, and traditional (TRAD) darks should be scheduled when the DS is expected to be in traditional readout mode already, resulting in a much reduced number of opportunities, but better data. This constraint is to minimize detector ASIC temperature drifts after switching readout mode that can negatively impact dark data.
