ABSTRACT

This program will obtain full frame NIRSpec dark exposure in NRSRAPID and NRSIRS2RAPID readout modes in order to create updated dark and bias reference files. Five epochs (with overlap) are implemented via between special requirements, so that darks can be acquired throughout cycle 2. This is in order to have enough contemporary dark data to create new reference files every 4-6 months, as the hot pixel population is changing over time. Observations can be executed in parallel with no constraints on pointing.

Ideally, IRS2 darks should be scheduled when the detector system is expected to be in IRS2 readout mode, and traditional (TRAD) darks should be scheduled when the DS is expected to be in traditional readout mode, based on nominal execution of the observation plan. This is to minimize detector/ASIC temperature drifts after switching readout mode that can negatively impact dark data.

This calibration program may change in response to system developments and the final Cycle 2 science program.

OBSERVING DESCRIPTION

OBJECTIVE: Obtain NIRSpec darks in NRSRAPID and NRSIRS2RAPID readout mode (both full frame) of sufficient integration length in order to create / update the SUPERBIAS, DARK, READNOISE, and REFPIX (IRS2 processing) reference files for NIRSpec.

METHOD: Take darks of appropriate integration length using the NIRSpec Dark template, executed as internal parallels. The length of the

integrations is currently foreseen to be 200 and 88 groups for NRSIRS2RAPID and NRSRAPID darks, respectively, and can be adjusted / better tailored once the integration lengths requested by G(T)O proposals for cycle 2 are known.

JUSTIFICATION: Cycle 1 calibration program confirmed that the dark is changing over time, with the most prominent change being the accumulation of additional hot pixels, likely due to cosmic ray induced radiation damage. The rate of increase is approximately 100 new hot pixels per detector per month, therefore regular updates of the dark (and bias) reference files and related bad pixel masks are necessary. We target to generate a new set of bias and dark reference files every 4-6 months, as this corresponds to a (relative) change in hot pixels of about 5-10% between updates.

Due to recent improvements in the bias/dark reference file creation tools (better cosmic ray and snowball removal) we can now create dark reference files with sufficient signal-to-noise and good data quality flagging with fewer input files, and therefore request 50 darks for each readout mode over the course of cycle 2.

CYCLE 1 CALIBRATION: Continuation of cycle 1 calibration program ‘NRS Full Frame Darks’ (PID 1484).

TIMING CONSTRAINTS: We will employ a set of ‘between’ special requirements to ensure that darks are spread out over the course of cycle 2, as they are changing over time (see justification above). Five epochs 4 months long each, with a spacing of 2 months for to allow for some scheduling flexibility. Ideally, IRS2 darks should be scheduled when the detector system is expected to be in IRS2 readout mode, and traditional (TRAD) darks should be scheduled when the DS is expected to be in traditional readout mode already. This is to minimize detector/ASIC temperature drifts after switching readout mode that can negatively impact dark data.
