

Figure 7

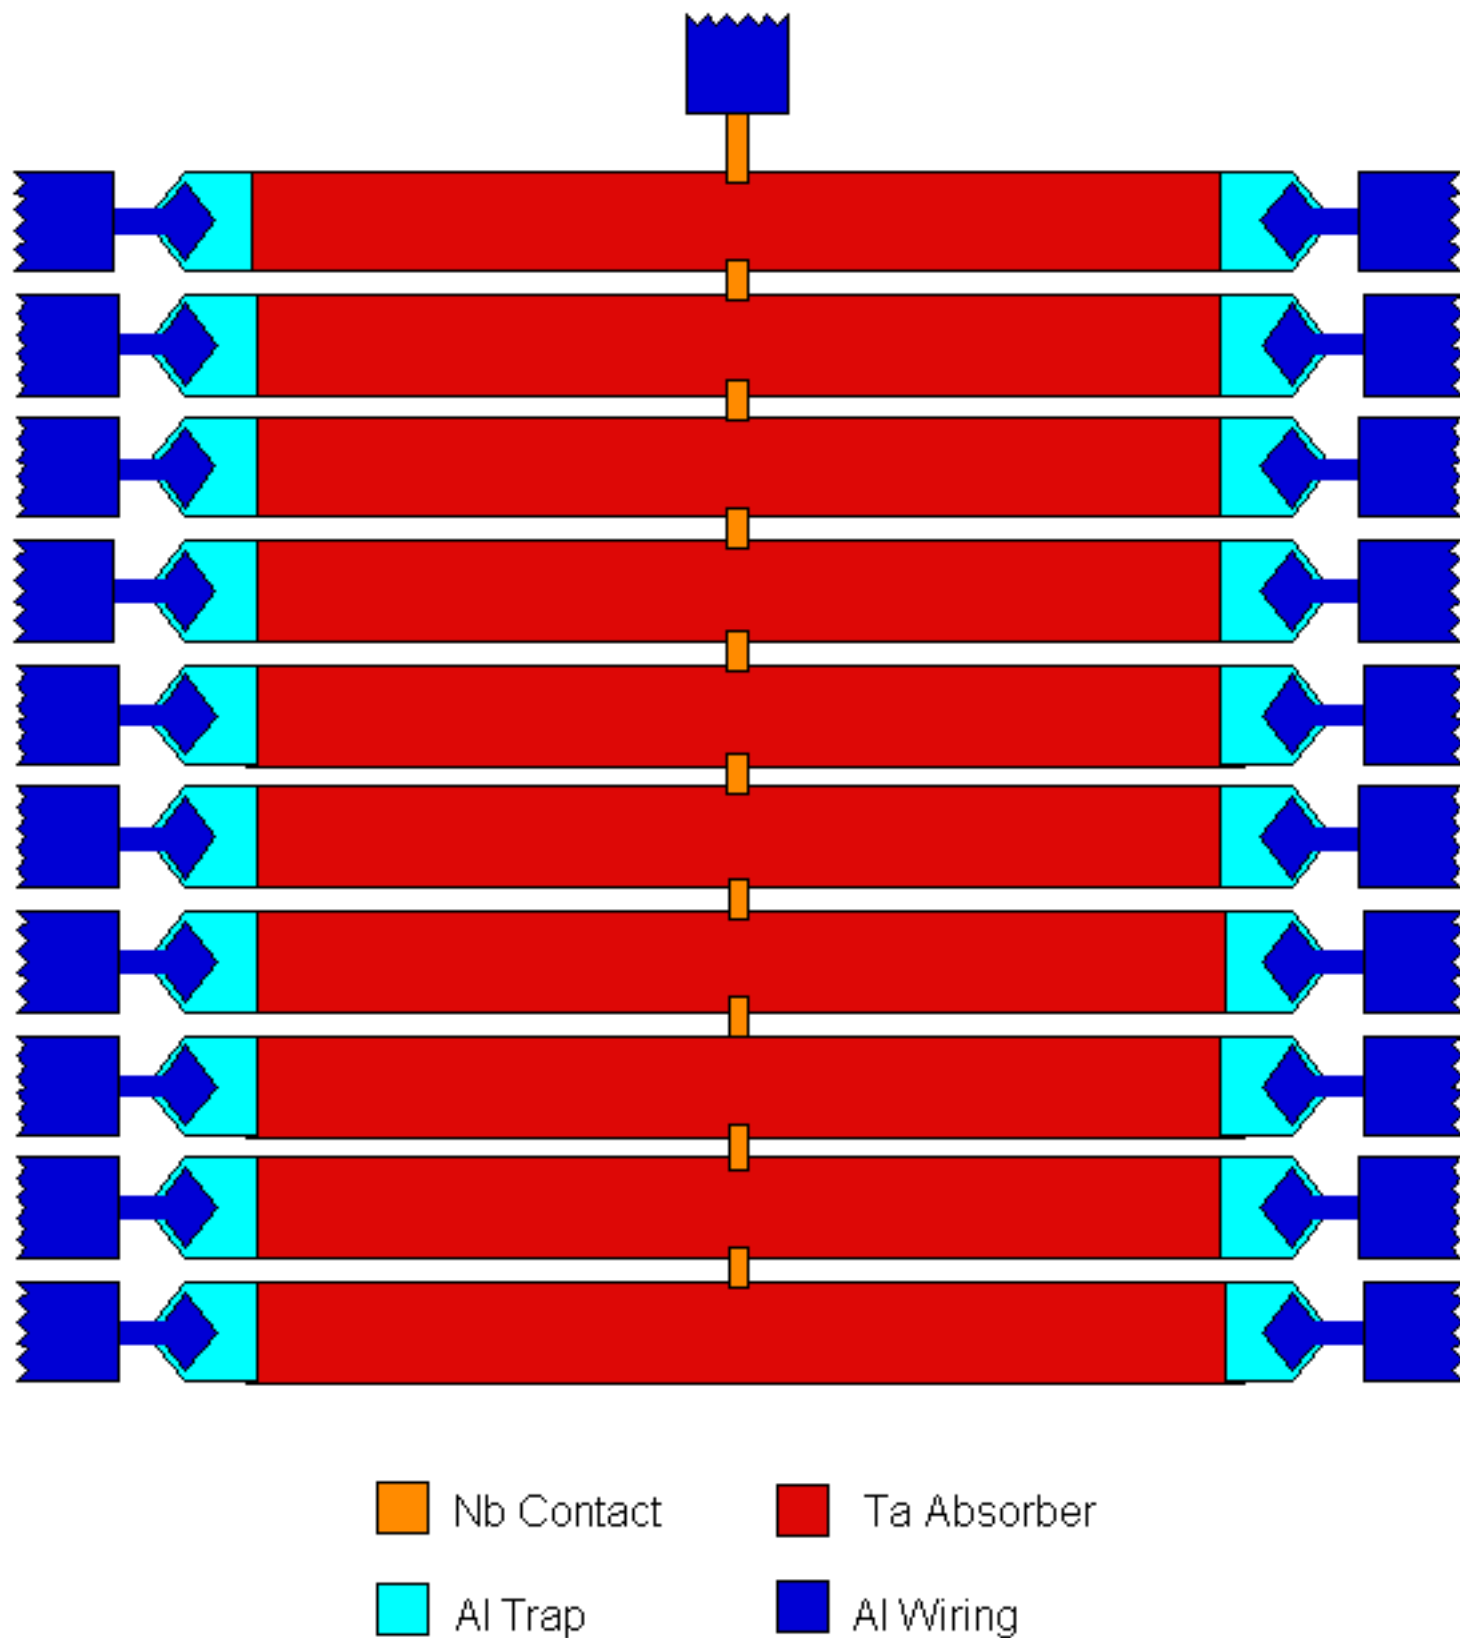

Fig. 7 Proposed 450 pixel camera design, for use on the Palomar 200 inch telescope. The first design will use a cold FET readout of each STJ, and achieve $E/DEH 45$ at $E = 5$ eV. An imaging fiber bundle will provide coverage in the visible into the near-UV. (C. Wilson, D.Prober, D.Schiminovich, and C. Martin, unpublished)
