

Figure 1

IR imaging with NGST can find many galaxies to $z \geq 10$ (if they exist).

Figure 1. 30" by 30" NGST field simulated by Im & Stockman (1997). Selected galaxies are labeled with their redshifts. Other galaxies at $z > 7$ in the upper left corner are indicated with arrows. Further details can be found at <http://www.ucolick.org/~myung/ngst.html>
